Introduction

The Cambridgeshire Local Cycling and Walking Infrastructure Plan (LCWIP) forms part of the Government's ambition to increase walking and cycling, particularly to school, in the UK by 2025 as outlined in the first Cycling and Walking Investment Strategy (CWIS, 2017) and more recently the CWIS 2 published in July 2022. The CWIS sets out the Government's aim to make walking and cycling the natural choice for shorter journeys, or as a part of a longer journey. The strategy's targets, by 2025 are to:

- Increase the percentage of short journeys in towns and cities that are walked or cycled from 41% in 2018 to 46% in 2025, 50% in 2030 and to 55% in 2035.
- double cycling, where cycling activity is measured as the estimated total number of cycle stages (a trip consists of one or more stages, for example a trip to London could be made up of 3 travel stages, cycling to the station, taking the train and walking to the destination from the London station) made each year, from 0.8 billion stages in 2013 to 1.6 billion stages in 2025.
- increase walking activity, where walking activity is measured as the total number of walking stages per person per year, to 365 stages per person per year in 2025, and to work towards developing the evidence base over the next year.
- increase the percentage of children aged 5 to 10 that usually walk to school from 49% in 2014 to 55% in 2025.
- deliver a world-class cycling and walking network in England by 2040

Following publication of the CWIS 2017, government guidance recommended that local authorities should develop Local Cycling and Walking Infrastructure Plans for their area and the Department for Transport has advised that local authorities who have plans will be well placed to make the case for future investment.

LCWIPs are a new approach to identifying cycling and walking improvements required at the local level. They should enable a long-term approach to developing local cycling and walking networks, ideally over a 10 year period and should:

- identify cycling and walking infrastructure improvements for future investment in the short, medium and long term
- ensure that consideration is given to cycling and walking within both local planning and transport policies and strategies
- make the case for future funding for walking and cycling infrastructure.

The LCWIP forms part of a long-term vision to improve the County's walking and cycling networks in order to increase the number of residents travelling on foot and by cycle and thereby improve the health and well-being of all those living and working in the County.

The level of growth, with increases in housing and employment, particularly in Cambridge and South Cambridgeshire (Greater Cambridge), means that persuading more people out of their cars to more active travel is imperative if higher levels of air pollution are to be avoided and to ensure journey time reliability is not significantly reduced.

The aim is to build on the already high levels of cycling in Cambridge and to spread the cycling

culture out to the rest of the County whilst encouraging more walking by improving journeys in town centres and to schools and employment areas. Walking and cycling routes to transport hubs are particularly important and feature strongly in the routes proposed for improvement.

More people walking and cycling benefits the economy, health, social inclusion, air quality and well-being. Sustrans recently completed a 'Bike Life 2019' report for the Greater Cambridge area, more details of which can be found [here](#). This highlighted that the current level of cycling (280,000 miles a day in the area) saves the NHS £2.4 million a year and prevents 28 early deaths a year as well as saving 18,000 tonnes of greenhouse gas emissions (the equivalent of 42,000 people taking flights from Stansted to Tenerife). Each mile benefits individuals and society 95p which adds up to an impressive £76.5 million annually from all trips cycled in the Greater Cambridge area.

The Bike Life 2019 report survey also highlighted the capacity and appetite of residents to cycle more as set out in *Figure 1* below, and the support for improving the streets for cycling and walking (*Figure 2*).

80% of residents in the Bike Life survey wanted more traffic free and physically segregated cycle infrastructure in order to cycle more which echoes research consistently showing that the biggest barrier to cycling is safety, particularly the perceived lack of safety of cycling with road traffic.

As set out in CWIS 2 the benefits of walking, wheeling (use of wheelchairs or mobility scooters) and cycling, were particularly strongly felt during the lockdowns of the COVID-19 pandemic in 2020 when many experienced the mental and physical health benefits of this daily activity, as well as rediscovering local shops and services in a largely motor traffic-free environment.

Figure 1: How do residents see themselves when it comes to cycling?

Figure 2: Proportion of residents who support measures to make places better for people

Local context

Cambridgeshire is a diverse county, formed by Cambridge city, several market towns and large rural areas. Significant growth, is planned for much of the County as shown in *Figure 3*.

This growth will result in the region of 77,000 new homes and 68,000 new jobs by 2031 if all of the development planned is realised. Growth is predicted to be particularly high within the Greater Cambridge area with an additional 60,000 people, 33,500 new homes and 44,000 new jobs. Huntingdon is due to experience the next largest growth with 20,000 new homes and over 14,000 new jobs.

Cambridge and its neighbouring areas form a globally significant high-tech & biotech cluster and the economic success of the area make it a very desirable place to live and work as well as a significant trip generator from the other regions of the county. Traffic congestion is already a problem and a significant increase in the level of walking and cycling is needed to mitigate this growth..

Figure 3: Growth in Cambridgeshire

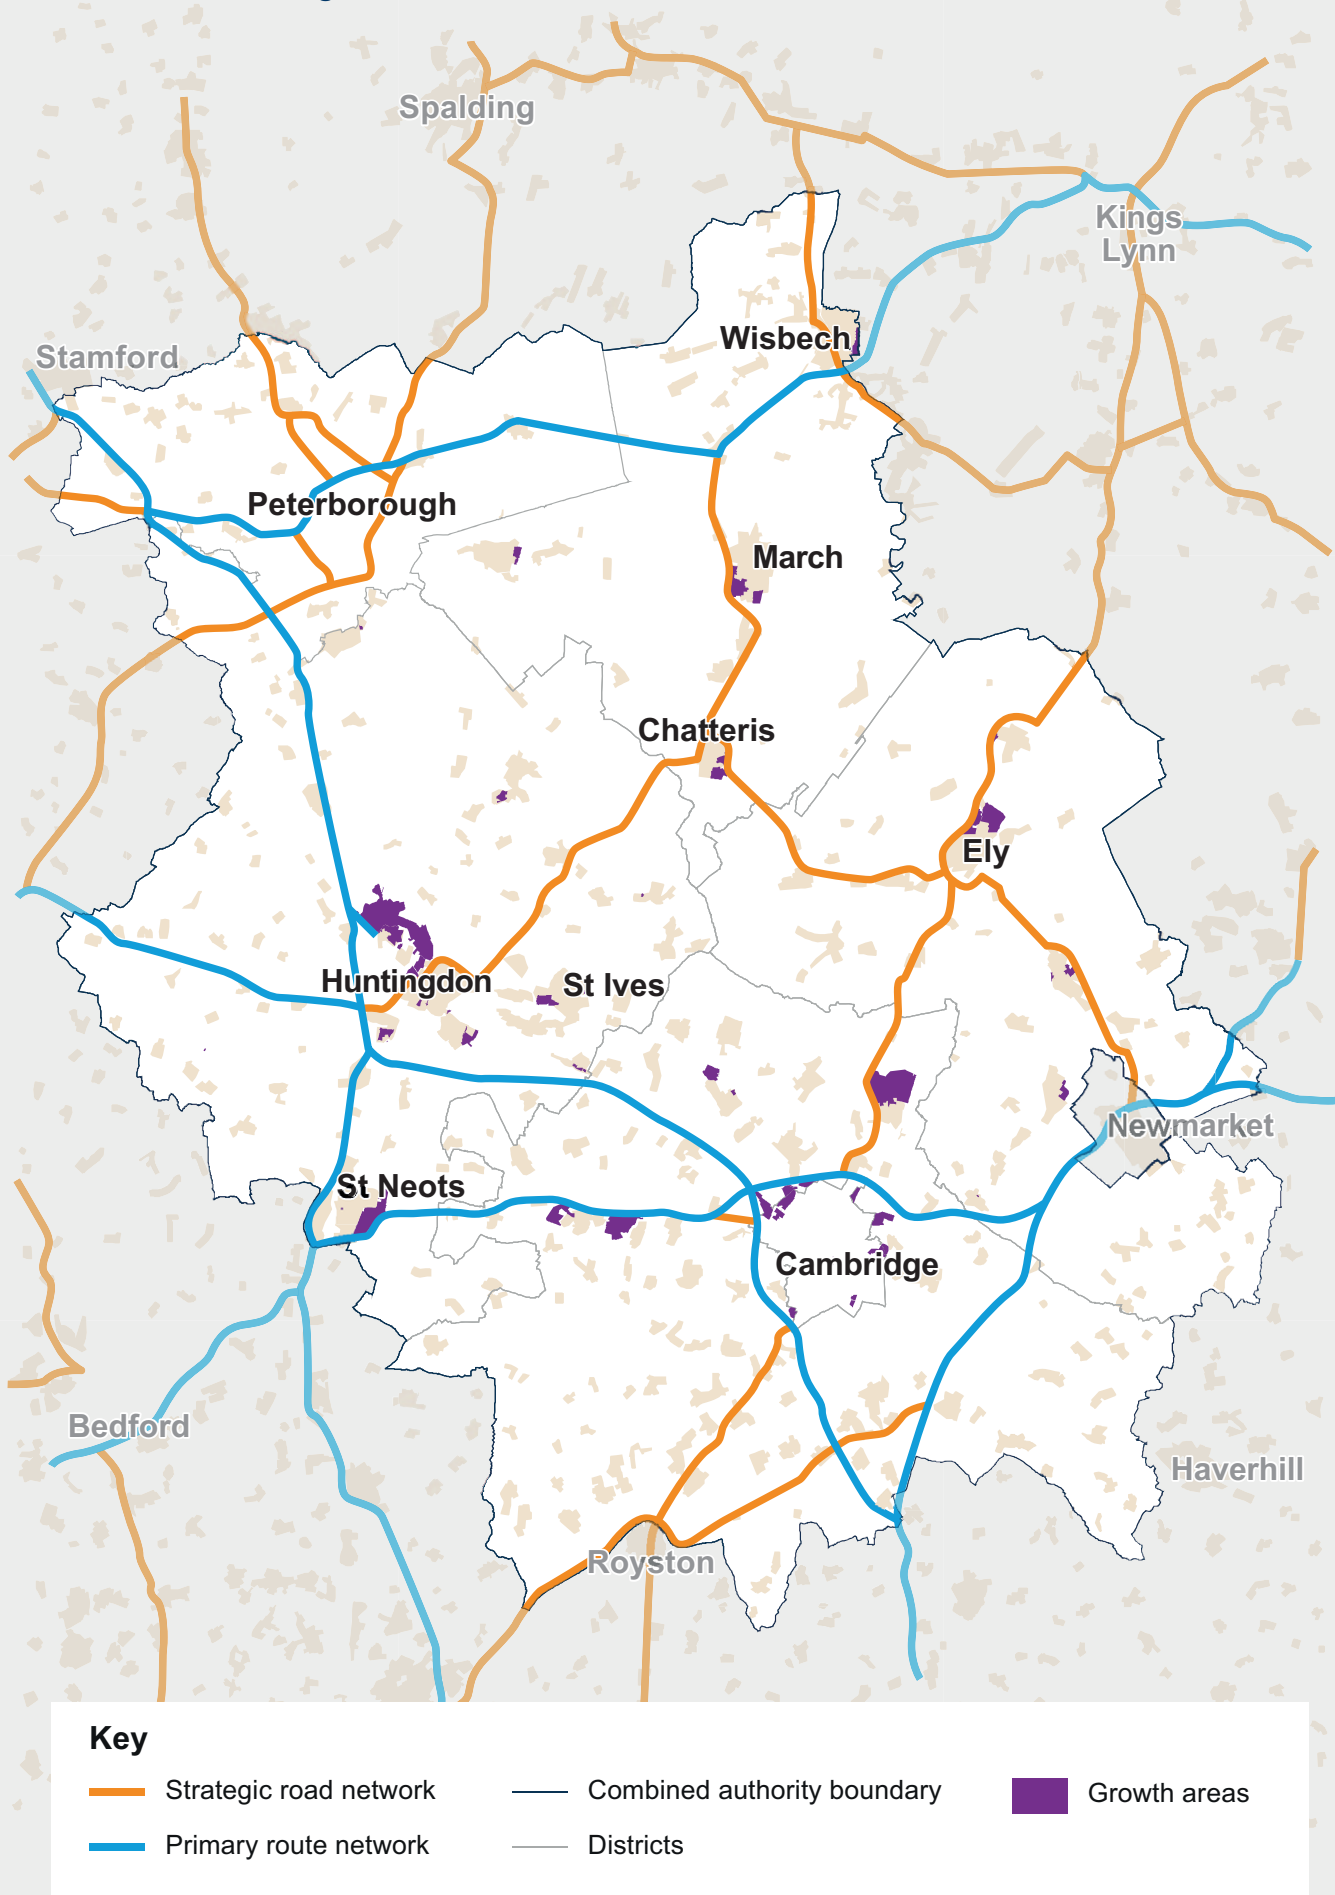

Figure 4: **Travel to Work 2011 Census**

At the same time Cambridgeshire is a predominantly rural county and many of the rural areas, particularly in the north of the county, suffer from problems related to social exclusion so access to high quality cycle routes to key destinations for work, education and health care is an important part of the Combined Authority, County and Districts' transport policies.

As demonstrated in the graph above, the number of people travelling by cycle in Cambridge compared to other forms of transport is significantly higher than the rest of the UK. The 2011 Census data showed that travel to work by

cycle in Cambridge was at 32%, an increase of over 12% since 2001 which is replicated in the 2018 Active Travel Survey showing 30.6% of residents cycling at least five times a week. The Cambridge cycling phenomenon is spreading to South Cambridgeshire with 8.5% of residents cycling to work, again an increase of 12% since the last census and reflected in the Active Travel Survey showing 9% of residents cycling at least five times a week. This is borne out by results of the Bike Life 2019 survey for Greater Cambridge as set out below.

Figure 5: **How often are residents of Greater Cambridge walking and cycling?**
(Bike Life Survey 2019, Sustrans)

The modal share, however, had decreased in the rest of the County with East Cambridgeshire at 3% (a decrease of 26%), Huntingdonshire at 3.9% (a decrease of 21%) and Fenland at 4.9% (a decrease of 34%). There are pockets, however, where the cycling levels are shown as higher such as in St. Ives East where 6.8% cycled to work in 2011.

The Active Travel Survey showed that 2.3% of Fenland residents cycled at least five times a week which is lower than the national average of 3.3% whilst East Cambridgeshire and Huntingdonshire were slightly higher at 5%. An important part of the challenge, therefore, is to spread the culture of cycling out further to the surrounding districts whilst increasing the already high levels in the Greater Cambridge area in order to mitigate growth.

With regard to walking levels the whole County had an increase in journeys to work on foot of between 9-14% according to the Census figures, with Fenland increasing to 10.3%. However, the

Active Travel Survey 2018 showed that Fenland had a relatively low level of walking nationally whilst Cambridge had amongst the highest levels with a third of residents walking five times a week.

The Covid-19 pandemic has had an impact on trends in transport and travel with less travel in general and more people working from home. Locally travel has reduced significantly in some places particularly in regard to bus and rail travel, whilst in others it has remained the same or increased. The Bike Life survey 2021, renamed the Walking and Cycling Index, which can be found [here](#), showed an increase in residents walking at least five times a week in the Greater Cambridge area but a drop in the number who cycle five times a week. The number who cycle at least once a week, however, has increased suggesting that many commuters who cycle are now working from home at least part of the week. There is still a lot of uncertainty about the extent to which changes will be long term.

Policy

‘More people cycling and walking more safely more often’

The directly-elected Mayor and the Cambridgeshire and Peterborough Combined Authority (CPCA) hold strategic powers and are the Local Transport Authority for the Cambridgeshire and Peterborough area. The Mayor sets the overall transport strategy for Cambridgeshire and Peterborough and is responsible for the CPCA Local Transport Plan which was approved by the CPCA board in January 2020. Included in the Local Transport Plan are the objectives to:

- Promote social inclusion through the provision of a sustainable transport network that is affordable and accessible for all
- Provide ‘healthy streets’ and high-quality public realm that puts people first and promotes active lifestyles

The document also includes policies for walking and cycling which aim to:

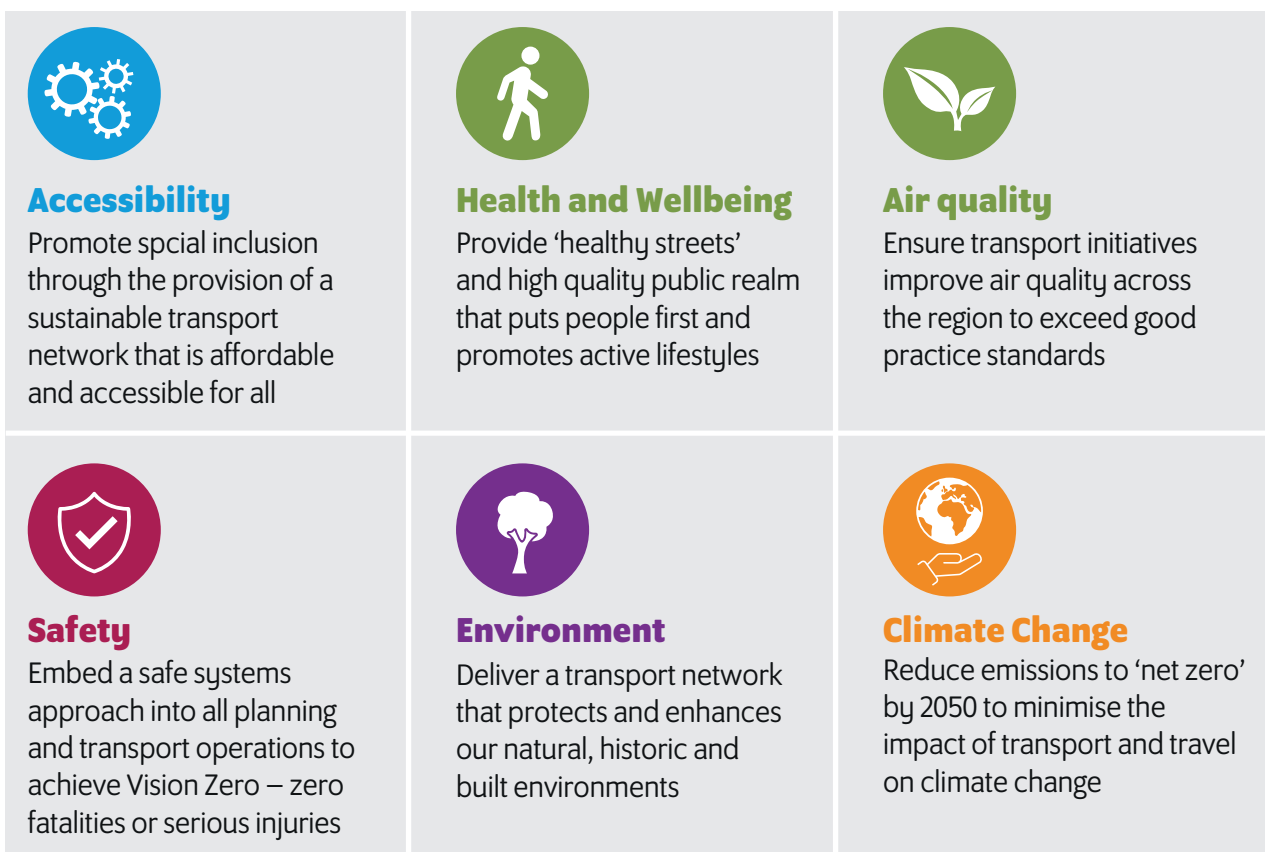

- Support an increased number of walking trips by establishing safe, interconnected pedestrian connections between key destinations across our cities and towns

- Increase the number of cycling trips through establishing safe and interconnected cycling links across the region’s cities, towns and settlements – will be supported by Local Walking and Cycling Infrastructure Plans to ensure that cycling and walking infrastructure investment is based on evidence and prioritised for greatest impact.

In line with this plan the CPCA’s Local Transport Plan 2020 sets an overall strategy of investing in world-class walking and cycling facilities which will create sustainable travel opportunities, reduce traffic flows and improve air quality through encouraging people to walk or cycle rather than drive for shorter journeys. It also states the need to ensure that walking and cycling, already popular transport modes within certain areas of the Combined Authority such as Cambridge, become more widespread across the region.

A new Local Transport and Connectivity Plan is being developed by the CPCA and the draft document is currently out to public consultation and includes the objectives relating to Active Travel, shown in *Figure 6*.

Figure 6: **Objectives relating to Active Travel within the draft Local Transport and Connectivity Plan**

Cambridgeshire County Council is also developing an Active Travel Strategy to which this LCWIP will be a daughter document. The Active Travel Strategy Action Plan will build on the work of the LCWIP and identify and prioritise further gaps in the network, particularly in more rural areas where there are few options for those without access to a car, thus forming a second tier of routes for each district.

This document has also taken into account the existing district and market town transport strategies and will feed into future delivery plans as well as emerging district and transport strategies.

District documents have also been taken into consideration such as the Huntingdonshire Infrastructure Delivery Plan and Prospectuses for Growth for some of the market towns.

LCWIP cycling

Methodology

As part of the LCWIP process, a working group was formed in July 2018 comprising Cambridgeshire County Council officers and different local stakeholders including Camcycle, Cycling UK and the British Horse Society. The group decided that the LCWIP should cover the whole County.

Following Department for Transport (DfT) recommendations, the 2011 Census data has been utilised as the key data source. This is the only data set currently available which gives the necessary level of detail for existing journeys to work. The Census 2011 origin destination data table WF02EW “Location of usual residence and place of work (OA/WPZ level)” is the specific baseline data. This data provides origin and destination information for all trips between each output area (OA) and workplace zone (WPZ).

A number of nodes were designated for the County, typically placed in the centre of villages, major junctions, and at train stations. Each of these nodes was connected with links that give a resulting potential cycling network of 534 ‘nodes’ and 1022 ‘links’. *Figure 7*, overleaf, is an example of what this looks like for the Cambridge area.

Additional links were added directly between railway stations and designated as railways links not cycle links. An assumption was made that if a workplace zone is located in Inner London and the usual residence is close to a railway station, then a cycle route from the Cambridgeshire residence to the railway station would be modelled. In addition, if the destination was close to a railway station and the origin was within cycling distance of a railway station, then the trip was modelled as a cycle to the station and then a walk or cycle from the station to the destination.

All of the trips from the 2011 Census Data were mapped, establishing the cycling distance for each trip. This distance was then analysed using a propensity to cycle tool, establishing that the peak distance for cycling is at 2km with the majority of cycle trips between 1km and 5km. We assumed that at a distance of 10km, the propensity to cycle is one third of the propensity for cycling at 2km. At 20km, it is just 4%.

We mapped the origin and destination trips for 0-6km, 6-8km and 10km which offer a visual indication of what journeys the future cycle network should cater for. The images shown in *Figures 8–11* show how these look for journeys up to 6km in length for the different districts.

Figure 7: Node map with links for the Cambridge area

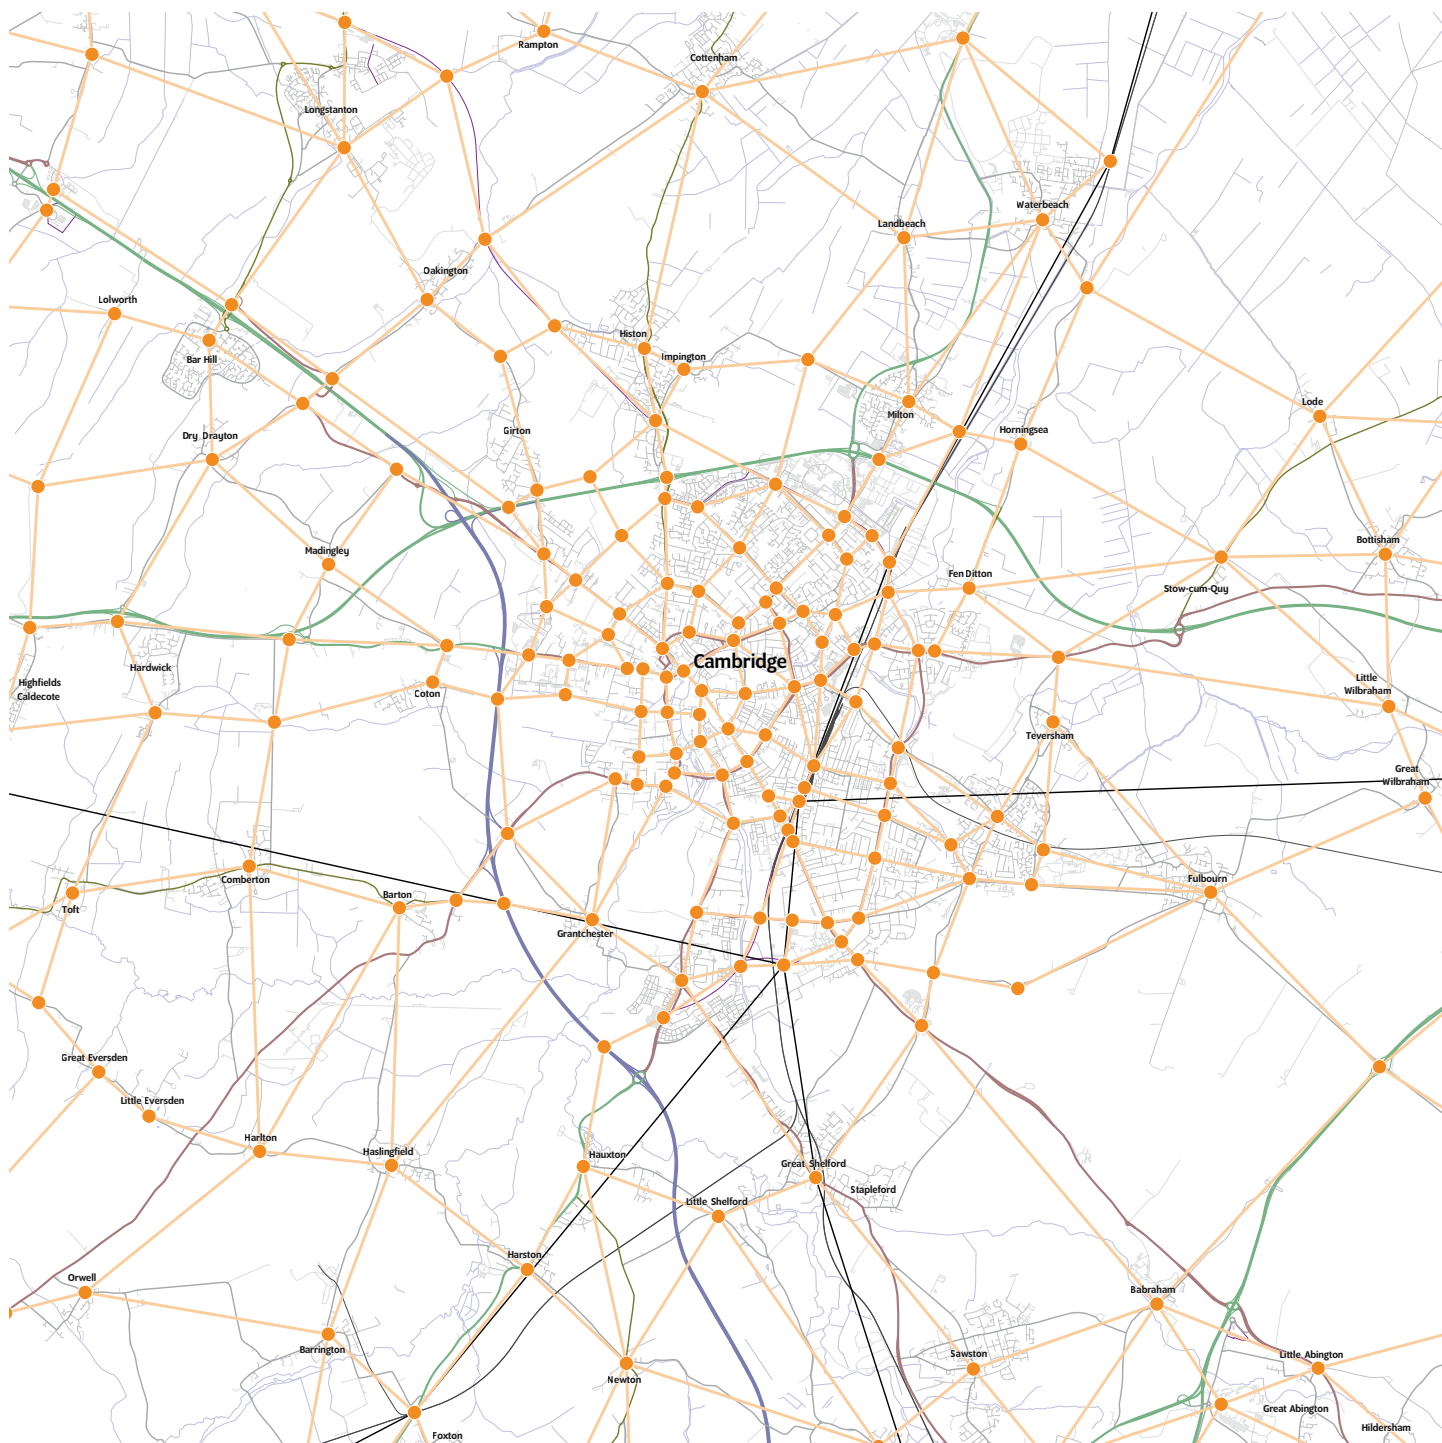

Figure 9: East Cambridgeshire

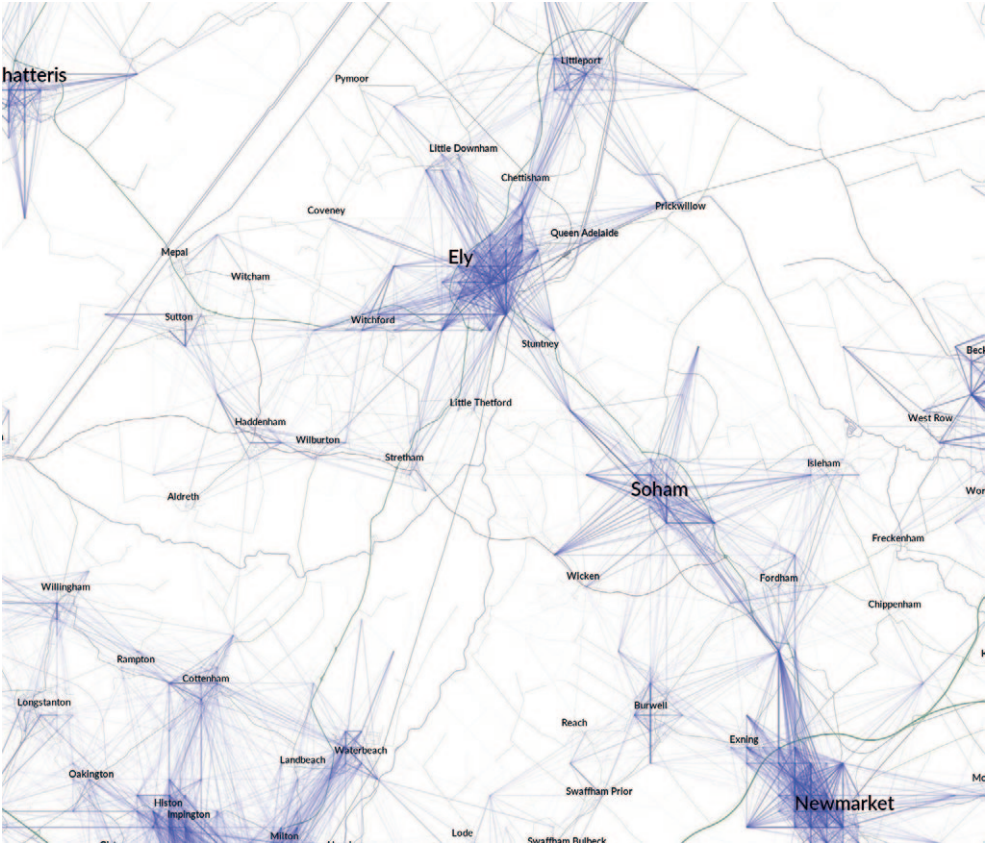

Figure 10: Huntingdonshire

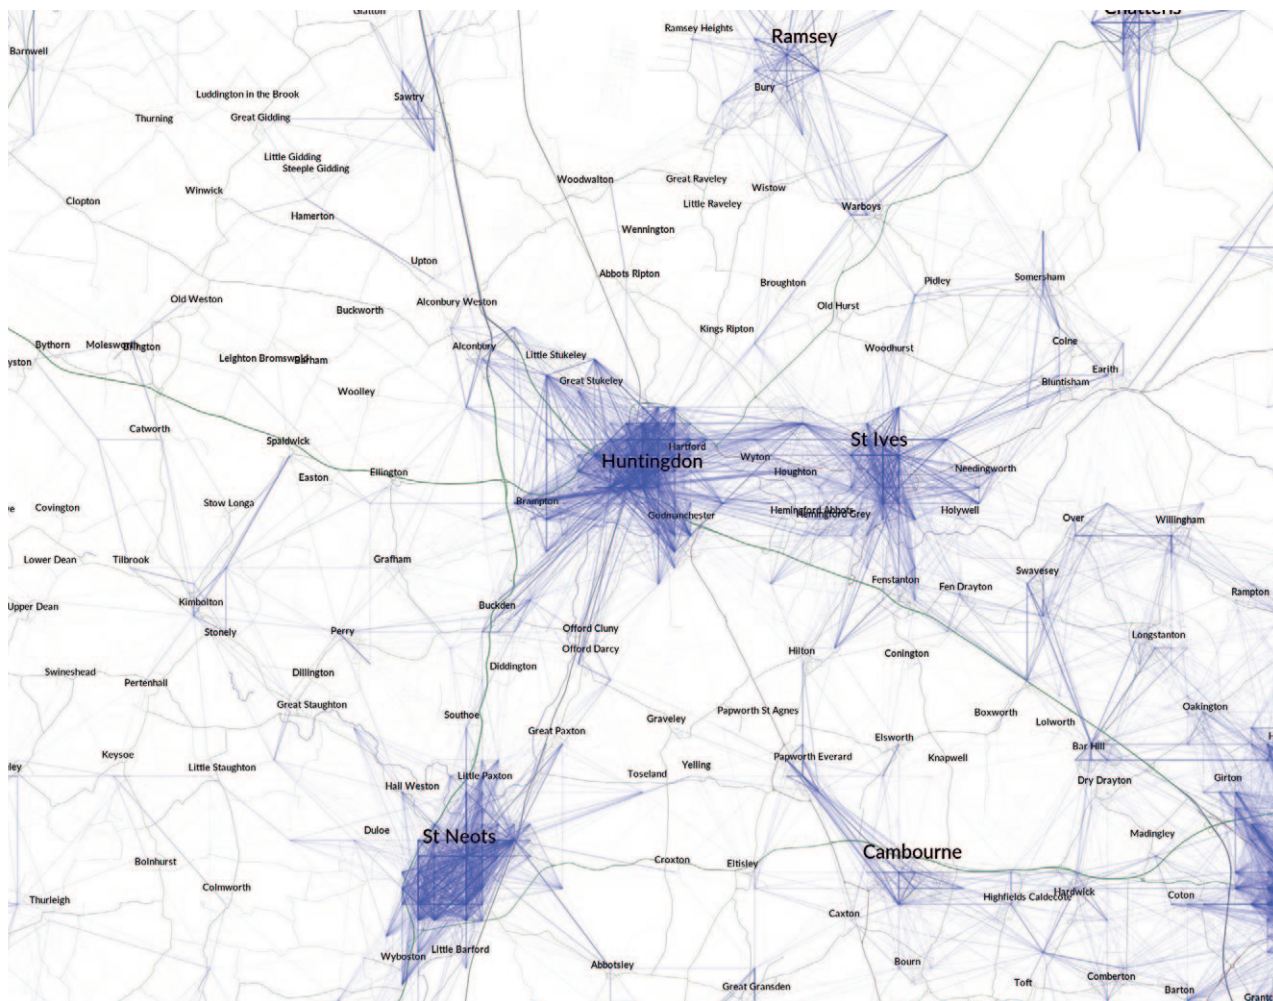

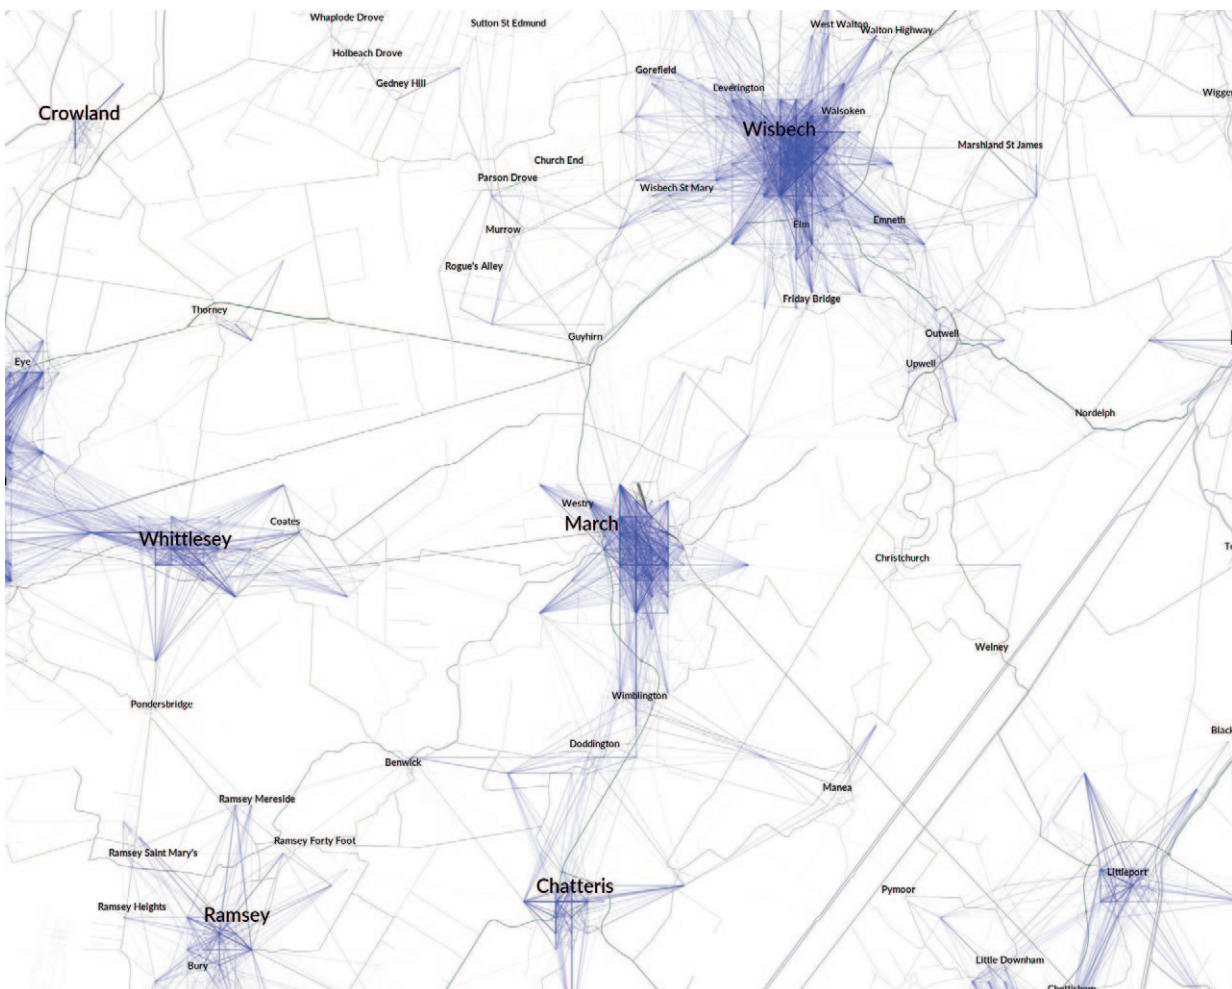

Figure 11: Fenland

In order to future proof our analysis we also factored in future growth (as set out in *Figure 3*) and so took into account the planned developments in the County. In doing so an assumption was made that there would be 2.4 people per dwelling and that 70% of those people would commute to work (based on the 2011 census).

The modelling compared the propensity to cycle based on a route with no cycle infrastructure to one with high quality infrastructure by doubling the distance of each route if no infrastructure is provided. This then determined the number of additional people that could be attracted to cycle each route if improvements are made.

The number of additional people cycling was divided by the distance of any proposed scheme in order to calculate the value of each proposed

scheme. This only takes into account commuting traffic. It is important to highlight that the distance of any given scheme has an impact on the total estimated costs, thus the value is lower on longer proposed schemes. This value figure is just for comparative purposes and in the case of a project moving forward further assessment would be needed using a tool such as the DfT's WebTAG unit A5-1 to obtain a Benefit Cost Ratio

Following on from this analysis, we obtained a list of the most highly scoring links for all of the districts: Cambridge, South Cambridgeshire, Huntingdonshire, East Cambridgeshire and Fenland.

These links were then translated into routes. To this list were then added some additional routes which were felt to be important gaps in the network. These had been identified through other

means such as the CPCA LTP, Cambridgeshire County Council's Transport Investment Plan process, Area Action Plans, district Local Plans, and associated Supplementary Planning Documents as well as neighbourhood plans and the Buckden Parish LCWIP.

The Greater Cambridge Partnership (GCP), a partnership of Cambridgeshire County Council, Cambridge City Council, South Cambridgeshire District Council and the University of Cambridge, is leading on the Greenway routes which span from South Cambridgeshire into Cambridge and these routes have been added. Sections of these routes were highlighted by the process as set out above but we felt it was easier to keep these routes separate given the work already undertaken. These Greenway routes currently

consist of a mixture of existing, but often substandard, infrastructure and gaps in the network and aim to improve commuter connections from the necklace villages around Cambridge into the city as well as to the village colleges/secondary schools. They were consulted on from a very early stage with stakeholders and local residents inputting into the options for each route. This initial consultation showed high levels of support for the individual routes which have all been costed and prioritised. Design work and further engagement are currently underway on the preferred options.

Appendix 1 shows the mapped and prioritised routes for each district as well as planned and funded schemes and the existing network.

Cycle Infrastructure Improvements

Given the resources available, and the large area that the LCWIP is covering, the assessment of each route and proposals for improvement are indicative and have been undertaken at a high level. The Active Travel trial schemes which have been or are about to be implemented in response to Covid-19 are reflected in the proposals and will either become permanent or will help to inform more permanent improvements.

In the provision of new cycle infrastructure we will refer to the Department for Transport's LTN 1/20 Cycle Infrastructure Design.

It is recognised, however, that where highway space is limited and private land acquisition or road re-allocation not possible, compromises may need to be made. Where meeting LTN 1/20 is not possible, this will need to be justified and a best alternative design that achieves the optimum solution within the constraints of land and budget will be sought in collaboration with partners and local communities.

Cambridgeshire County Council is creating a Non-motorised user Design Guide which will include guidance on providing for people walking, cycling, wheeling or riding a horse and mobility scooter users, all of whom need to be considered when designing active travel routes. In rural and semi-

rural areas it will be particularly important to provide for equestrians.

Many of the streets in urban areas and high streets in the villages are difficult to significantly improve for cyclists given the widths available and here the focus is on reducing the speed of traffic. In some cases it may be possible to reduce the volume of traffic by limiting motor vehicular traffic travelling through the area. The 'Healthy Streets' approach should be a guide when implementing improvements in these areas.

In Cambridge the Greater Cambridge Partnership, (through the Making Connections project), is looking at methods of reducing motor vehicular traffic within the city which could provide the opportunity to make significant improvements for active travel, particularly at junctions. The Cambridge Road Network Hierarchy review will also be important in informing suitable walking and cycling infrastructure for the different types of road and inform any reallocation of road space.

In addition to the specific infrastructure schemes we would also aim to increase cycle parking in areas of high demand such as in town centres, train stations, local shopping centres, schools and community facilities. As part of further feasibility work on schemes installation of cycle parking would be included where appropriate.

Prioritisation

Using Cambridgeshire County Council's criteria for prioritising cycling schemes (Cambridge Area Cycleways Programme – Prioritisation Process April 2006) and the example prioritisation table

within the Department for Transport LCWIP technical guidance as a basis, we developed the following prioritisation criteria for our cycling schemes as shown in *Figure 12* below.

Figure 12: **Criteria for prioritising cycling schemes**

Economy

The Greenway routes in order of priority are set out in *Figure 14* overleaf. More detail on all of the Greenways can be found here [Greater Cambridge Greenways – Greater Cambridge Partnership](#).

LCWIP walking

Methodology

As outlined in previous sections of this report, the LCWIP is a countywide Strategy. Due to the size of the area, we have focused the analysis on Cambridge, Ely, and the larger Market Towns, which are Chatteris, Huntingdon, March, Soham, St Ives, St Neots, Wisbech and Whittlesey. As the largest settlement in South Cambridgeshire we have also included Cambourne.

For each location we have identified a core walking zone as set out in the Department for Transport LCWIP Technical Guidance. The core walking zone consists of a number of walking trip generators located close together and is generally the town centre area. We have included shopping areas, transport hubs,

business parks/employment areas, schools, leisure centres and community buildings as trip generators outside the core walking zone and mapped the main walking routes to these. We have used the Cambridgeshire County Highways footway maintenance hierarchy classification to inform choice of routes to include those footways which are in the top four categories. The core walking zone includes most of the footways which are in category 1.

The County Council's Market Town Transport Strategies and District Transport Strategies have identified priorities for improvements for walking and these have fed through into the County Council's Transport Investment Plan (TIP) which is reviewed and updated every year. These identified schemes also inform this walking plan.

Many of the routes are also priorities for cycle improvements. Maps setting out the proposed priority walking routes and core zones can be found in *Appendix 3*, they also highlight those routes which are both walking and cycling priorities.

The aim is to encourage more people to walk when making short journeys and we hope to do this by focusing on the identified streets and core walking zones to make them pleasant and attractive places to be with the implementation of the following types of improvements, again using the Healthy Streets approach as a guide:

- 20mph speed limit within the Core Walking Zones and residential areas
- Widening footways to 2m, wider in the city/town centres or on routes to school where space allows.
- Lighting improvements
- Resurfacing
- Signage/wayfinding
- Removal of any barriers that cause an obstacle to pedestrian movements, particularly for those with disabilities
- Levelling any footway with a steep camber where possible in order to make it usable for those in a wheelchair or with mobility problems.
- Addition of crossings where needed
- Dropped kerbs and tactile paving at all crossing points
- Narrowing side roads junctions to reduce vehicle speeds and implement priority style treatment where appropriate – see *Figure 15* as an example of what this can look like.
- Seating
- Improvements to the public realm such as additional planting where possible

Figure 15: Pedestrian priority treatment

- Consideration of limiting motor vehicle through traffic where appropriate

We also propose a number of generic interventions, as set out below, to improve walking in the rest of the villages and rural areas that were not analysed as part of the LCWIP exercise and as part of this have considered some of the matters outlined in the Rights of Way improvement Plan (2016) to establish our proposals. We will also ensure that any improvements to bridleways are also beneficial to those riding horses.

- Lower speed limits
- Improvement of way marking for Public Rights of Way (PROW)
- Improved accessibility – ie. replacement/removal of gates and barriers that make access to PROW paths difficult for residents with mobility or visual impairment

Prioritisation

Once identified the walking routes were then audited (by Sustrans) and scored using the Walking Route Audit Tool, which can be found in *Appendix 4*. Routes which have recently been improved or are part of already funded schemes

were not included in the audit. These audits then fed into a prioritisation matrix for Cambridge, Ely, Cambourne and each of the Market Towns based on the one used for cycling schemes. *Figure 16* below sets out the criteria.

Figure 16: **Prioritisation matrix**

The prioritisation matrices for Cambridge, Ely, Cambourne and the Market Towns can be found in *Appendix 5* of the report.

Cambridge

Cambridge is a compact city with around 124,000 residents according to the 2011 Census. 24,506 of these residents are students of the two universities based in the city, the world-renowned University of Cambridge and Anglia Ruskin University.

Cambridge city centre includes University of Cambridge buildings and college buildings as well as retail, food and drink businesses and the Market Square which has a 7 day a week market. The footfall in the area is high with different trip

purposes: work, leisure, studying, shopping and tourism amongst others.

The Core Scheme has been a phased project over the last 25 years which has restricted motor vehicles usage in some key city centre streets, initially with the use of rising bollards and more recently with camera enforcement. The Greater Cambridge Partnership aims to reduce vehicular traffic in Cambridge, particularly the central area and this should provide the opportunity to enhance the public realm for the benefit of those travelling on foot or by cycle.

Cambridge City Council have been working on planning guidance for the city centre called 'Making Space for People' currently in draft form. It covers the central area as well as Hills Road to

the Station and beyond to Cambridge Leisure, Mill Road and the Eastern Gateway area (see *Figure 17*). The document highlights the need to reduce the dominance of motor vehicles in this area and the baseline report identified the following key issues for people walking:

- Achieving greater pedestrian priority in more city centre streets
- The interaction between cyclists and pedestrians in key streets
- Wayfinding
- Street lighting and personal safety after dark
- Pedestrian safety and convenience at key junctions and routes

The area covered by the 'Making Space for People' guidance (see *Figure 17*) is a priority for pedestrian movement and all of the key streets

fall within category 1a – 2 of Cambridgeshire County Council Highways Footway Maintenance Hierarchy as well as key off-road paths.

Cambridge City Council is also working on changes to the Market Square which are focused on significant improvements for those on foot with more seating, more space, and more consistent and accessible surface materials.

Following the methodology used for the Market Towns we identified significant trip generators outside of the central area such as the Biomedical Campus in the south of the city, the West Cambridge site in the west and the Science Park in the north, all of which are major employment sites. We have also shown the secondary schools and colleges outside the city centre. The mapped routes are to these trip generators and also include neighbourhood centres such as Chesterton and Cherry Hinton High Streets.

Summary and conclusion

Cambridgeshire is a diverse county but with its flat terrain and compact city and market towns it offers a great opportunity to increase the number of local journeys made on foot and by cycle.

The Greater Cambridge area already has a strong cycling culture and the Bike Life survey underlined residents' support for more segregated cycle routes away from traffic. These routes are needed to persuade more people to get on their bikes and mitigate the effects of growth on the County's traffic levels.

Cycling and walking, both for short trips, and when longer journeys are combined with bus and rail, brings better accessibility to employment, education and services across the County. When walking and cycling are part of an everyday journey to work, school, leisure activities and shopping it is an easy way to stay fit and healthy both mentally and physically. More active travel leads to better productivity, less congestion, better air quality, increased footfall in shops, a better sense of community in an area and more vibrant places to live, work and visit.

The LCWIP forms part of the continuing work to increase the level of walking and cycling throughout Cambridgeshire. As set out in the Department for Transport guidance it identifies key routes based on origin – destination data in order to replace short car journeys with walking and cycling as the mode of travel of choice, and will help to form the basis for future funding bids.

The emerging Active Travel Strategy will be an important parent document which sets out the changes needed to ensure that providing for, and promoting Active Travel will be at the heart of what the County Council does and will identify a further set of cycling and walking routes which are needed to provide a comprehensive network which links communities throughout the County.

The LCWIP is not a static document and will be reviewed and updated on a regular basis to reflect changes such as new Local Plans, new developments, and new schemes such as the High Street Fund work. Long term travel patterns remain uncertain following the pandemic but the 2021 census information will still be a useful source of information for the next review of the document.
