

29 January 2018

**To: Members of the Greater Cambridge City Deal Executive Board:**

Councillor Francis Burkitt	South Cambridgeshire District Council (Chairman)
Councillor Lewis Herbert	Cambridge City Council (Vice-Chairman)
Phil Allmendinger	University of Cambridge
Councillor Ian Bates	Cambridgeshire County Council
Claire Ruskin	Greater Cambridge Greater Peterborough Enterprise Partnership

Dear Sir / Madam

You are invited to attend the next meeting of **GREATER CAMBRIDGE PARTNERSHIP EXECUTIVE BOARD**, which will be held in the **COUNCIL CHAMBER** at South Cambridgeshire Hall on **THURSDAY, 8 FEBRUARY 2018** at **4.00 p.m.**

**Requests for a large print agenda must be received at least 48 hours before the meeting.**

---

<b>AGENDA</b>		<b>PAGES</b>
<b>1.</b>	<b>Apologies for absence</b>	
<b>2.</b>	<b>Executive Board membership</b>	
<b>3.</b>	<b>Declarations of Interest</b>	
<b>4.</b>	<b>Minutes of the Previous Meeting</b> To authorise the Executive Board to sign the Minutes of the meeting held on 22 November 2017 as a correct record.	<b>1 - 18</b>
<b>5.</b>	<b>Questions from Members of the Public</b>	
<b>6.</b>	<b>Overview from the Chairman of the Joint Assembly</b>	<b>19 - 22</b>
<b>7.</b>	<b>Rapid Mass Transit Options Appraisal</b>	<b>23 - 36</b>
<b>8.</b>	<b>A10 Foxton level Crossing bypass and travel hub</b>	<b>37 - 138</b>
<b>9.</b>	<b>Cambridge to Ely A10 Transport Study</b>	<b>139 - 228</b>
<b>10.</b>	<b>Our Big Conversation</b>	<b>229 - 340</b>

**11. Rural Travel Hubs**

**341 -  
442**

**12. Date of Next Meeting**

To note that the next meeting will take place on Wednesday 21 March 2018 at 4pm in the Kreis Viersen Room, Shire Hall, Cambridge.

## **GREATER CAMBRIDGE PARTNERSHIP EXECUTIVE BOARD**

Minutes of the Greater Cambridge Partnership Executive Board held on  
Wednesday, 22 November 2017 at 4.00 p.m.

### **Members of the Greater Cambridge Partnership Executive Board:**

Cllr Francis Burkitt (Chairperson)	South Cambridgeshire District Council
Cllr Lewis Herbert (Vice Chairperson)	Cambridge City Council
Phil Allmendinger	University of Cambridge
Cllr Ian Bates	Cambridgeshire County Council
Mark Reeve	Local Enterprise Partnership

### **Members of the Greater Cambridge Partnership Joint Assembly in Attendance:**

Councillor Kevin Price (Joint Assembly Chairperson)  
Councillor Tim Bick

### **Officers/advisors:**

Chris Malyon	Cambridgeshire County Council
	South Cambridgeshire District Council
	Cambridgeshire County Council
Niamh Matthews	Greater Cambridge Partnership
Rachel Stopard	Interim Chief Executive, Greater Cambridge Partnership
Chris Tunstall	Interim Transport Director, Greater Cambridge Partnership
Victoria Wallace	South Cambridgeshire District Council

### **1. APOLOGIES**

There were no apologies for absence.

### **2. DECLARATIONS OF INTEREST**

There were no declarations of interest other than those already recorded on the Members' Declaration of Interest form.

### **3. MINUTES OF THE PREVIOUS MEETING**

The minutes of the meeting held on 20<sup>th</sup> September 2017 were confirmed as a correct record and signed by the Chairperson.

### **4. QUESTIONS FROM MEMBERS OF THE PUBLIC**

12 public questions had been submitted, 8 of which were accepted for the meeting as they related to reports on the agenda. The Executive Board **RECEIVED** and responded to these public questions as part of agenda items 7 and 9. The questions and answers are included as an appendix to the minutes.

Councillor Tim Bick, member of the GCP Joint Assembly, addressed the Executive Board

under this item. He expressed concern that the GCP had lost sight of its original aspiration to transform public transport access and that the GCP was not serious about deterring use of private vehicles in the city. He asked when demand management would be grasped and when would it be opened up to properly informed public debate. In response to this, Executive Board members made the following points:

- The feedback that came out of the 'Big Conversation' consultation would be considered.
- A package of measures was needed to reduce the number of cars and diesel vehicles coming into the city to tackle congestion and air pollution.
- The Board was still committed to reducing traffic in the city by 10% based on 2011 levels.
- It was premature to say what the consultants Steer Davis Gleave, who were conducting the rapid mass transit options appraisal, would recommend.
- It was advised that business could not deal with sudden changes so a planned approach was needed to enable businesses to adapt while still carrying out their business.
- Intelligent congestion charging could perhaps form part of a coherent transport strategy, to generate an income stream to improve public transport and sustain this in order to get more people to use public transport rather than their cars.
- The Chairman advised that full congestion charging was deeply unpopular with some residents, particularly those living outside the City, and that two South Cambridgeshire District Council resolutions against this had been passed. Public buy-in was needed for whatever was taken forward, which took time.
- The Executive Board advised that the City Access Strategy was to be discussed at its meeting in March 2018, with public debate starting then.

## 5. OVERVIEW FROM THE JOINT ASSEMBLY CHAIRMAN'S REPORT

The Executive Board **RECEIVED** a report from the Chairman of the GCP Joint Assembly, which gave an overview of discussions from the meeting of the Greater Cambridge Partnership Joint Assembly, held on Thursday 2<sup>nd</sup> November 2017. The Joint Assembly Chairman welcomed this approach to the Joint Assembly reporting to the Executive Board and hoped that it would continue. The Joint Assembly welcomed the recommendations being presented to the Executive Board, which reflected that the views of the Joint Assembly had been taken into account.

The Executive Board was informed that a meeting had been arranged to take place in early December, between the Chairperson of the Western Orbital LLF and the Executive Board Transport Portfolio Holder. This was to discuss the responses to the LLF resolutions made at both its September and November 2017 meetings.

## 6. A1307 THREE CAMPUSES TO CAMBRIDGE

Councillor Tony Orgee, Chairman of the A1307 Local Liaison Forum (LLF), updated the Executive Board on the work of the LLF:

- Five workshops had taken place to develop options for the A1307 Haverhill to Cambridge corridor. 200 ideas had come forward which were grouped into 40 proposals. Three of the workshops looked at specific sections of the A1307.
- The three strategies set out in the officer report to the Executive Board had been developed by the LLF and had been presented at its meeting in September 2017. Councillor Orgee explained that all three strategies were identical between Fourwentways and Haverhill. The LLF agreed that all three strategies should be consulted on. Councillor Orgee emphasised that this did not mean that LLF members supported all three schemes.

- Councillor Orgee urged that the work on the A1307 Haverhill to Cambridge corridor should not be seen in isolation from the other work of the GCP and that the work of the GCP should not be seen in isolation from the work of other organisations, such as the Combined Authority and the Chamber of Commerce in Haverhill.
- Once consultation was over, the LLF urged that work on the uncontentioned section which was common to all three strategies be progressed with as quickly as possible.
- Councillor Orgee supported the removal of the park and ride sites from the consultation.

The Executive Board Chairman noted and thanked Councillor Orgee for his update and thanked the LLF on behalf of the Executive Board for their work.

The title of the project was discussed. The Executive Board Chairman proposed the name 'Cambridge South East Transport Study', which the LLF Chairman supported. The Executive Board asked the LLF to endorse the proposed new title.

The GCP Interim Director of Transport presented the report and the three strategies detailed within it. He drew the Board's attention to the cost implications of the three strategies. Strategy 2 and 3 were similar in cost however Strategy 1 was circa £145 million, but was more future proof than the other two strategies.

The following points of clarification were provided:

- Strategy 2 did not reference mode shift while the other two strategies did.
- The Executive Board was informed that the economic benefit of the £145 million spend on Strategy 1, was estimated to be £280-320 million.
- Environmental surveys would look at the presence of any protected species and ecologies. These surveys could only be carried out at certain times of the year and could not be carried out during the Spring and Summer. The survey data would then allow an environmental impact assessment to be carried out by specialists in environmental assessment.
- The public consultation would present the modelling of journey time savings clearly.

The report was discussed and debated, with the Executive Board making the following points:

- Members advised that Addenbrooke's Hospital needed to be closely engaged with and that views of staff on the Biomedical Campus needed to be taken into account.
- The Biomedical Campus' masterplan exercise needed to be factored in.
- Cost/benefit of the strategies and value for money needed to be detailed in the consultation and this made clear for the public to understand.
- The Vice Chairman advised that early investment was needed once consultation had been completed and a decision made following this.
- The Vice Chairman expressed support for leaving the option of light rail open. He was keen for more people in the area to commute by rail and for the GCP to contribute to the rail study. He had hoped for more commitment from central government to Cambridge South station than had been announced in the Autumn budget statement.
- The scheme needed to fit in with the strategy for the whole of the south of Cambridge.
- Mark Reeve supported all three strategies being consulted on provided the Board was reassured that all the options were deliverable. He questioned the cost/benefit of Strategy 1 and was sceptical of its economic benefit.
- The Chairman pointed out that one of the advantages of Strategy 1 was that it was

on an old railway line. He advised that the National Infrastructure report referred to land value capture and suggested that developer contributions could have a part in funding schemes such as this.

- The Chambers of Commerce in Haverhill and Suffolk should be engaged with as part of the consultation, as well as the relevant MPs.

The recommendations in the report were discussed. Members were advised that following discussions between the Chairman and GCP Interim Chief Executive and the release of new national documents, a new recommendation (iv) and new recommendation (v) were proposed. The wording of these was circulated to the Executive Board and members of the public at the meeting. The Interim Chief Executive explained the reasons for proposing these new recommendations which reflected the views of the Joint Assembly and the GCP's close working with the Combined Authority. All members agreed to the inclusion of these additional recommendations and a vote was taken on all recommendations:

The Executive Board **AGREED** unanimously to:

- i. Note the revised options and strategies resulting from the work with the Local Liaison Forum (LLF).
- ii. Note the increased cost of the strategies, more than the £39m previously estimated, as a result of additional options.
- iii. Approve the withdrawal of existing park and ride proposals at Babraham Village and Wild Country Organics pending new larger sites being identified.
- iv. Public consultation on the three strategies subject to Strategy 1 being considered as an off-road public transport corridor; with the most appropriate mode being the subject of further consideration and consultation at a later stage of scheme development following the outcome of this consultation.
- v. Consultation to aim to begin in February 2018 following discussion with the Mayor and Combined Authority on the content of the consultation.
- vi. Delegate authority to the Transport Director to approve public consultation materials in conjunction with the Chair and the Transport Portfolio Holder.
- vii. Approve environmental surveys to be carried out starting in January 2018 to meet seasonal windows for species.
- viii. Authorise officers to progress the design and planning of lower cost works within the public highway not requiring consents for early delivery, subject to consultation.
- ix. To rename the project 'Cambridge South East Transport Study' and ask the Local Liaison Forum to endorse this.

## 7. WESTERN ORBITAL

Helen Bradbury, Chairman of the Western Orbital Local Liaison Forum, was invited to address the Executive Board. She brought the following points to their attention:

1. **Process** – the LLF requested that more time be given between the publication of end stage reports and the timing of the subsequent Joint Assembly meeting so that it could better feed its recommendations, concerns and suggestions into the decision-making process. The timing structure made it difficult for the Joint Assembly to take account of the LLF's views and consequently the LLF did not

believe that its views, recommendations and suggestions were given adequate consideration. The LLF Chairman explained the considerable amount of work that needed to be done by the LLF in the time between reports being published and Joint Assembly meetings taking place. This had been particularly difficult for the LLF in September 2017 with a large number of documents to consider in 12 days between publication of the Joint Assembly papers and the subsequent meeting. The LLF therefore asked that the Executive Board recommend that an extra week be given between the publication of relevant end stage reports and the timing of the subsequent Joint Assembly meeting, to enable the LLF to carry out its relevant business within a reasonable timescale before the meeting.

2. **The park and ride at junction 11** – The LLF believed more information was needed and more options needed to be put forward to them in order to provide a considered response. The LLF queried why other locations around junction 11 had been rejected. The LLF acknowledged the importance of adequate park and ride provision near junction 11 of the M11 however had serious reservations about both the potential expansion of Trumpington park and ride and the potential development of a new park and ride on the Hauxton side of the M11. Regarding the potential expansion of the Trumpington park and ride, the LLF was concerned about visual impact on the local community, the impact on the local network if it was significantly expanded, what would happen during construction and the value for money per new parking space. Regarding the potential for a new park and ride site at Hauxton, the LLF was concerned about the impact of this on Hauxton and Harston villages, the effect on traffic through these already congested villages, access to the new site and further erosion of the green belt buffer between Cambridge and South Cambridgeshire villages. The LLF had passed a resolution at its 17 June 2017 meeting that the new park and ride should be sited before congestion began and as a general principal that new transport infrastructure should not be allowed to urbanise villages surrounding the city or unduly damage the city's greenbelt.

The LLF requested the following:

- a. Following the meeting with Councillor Bates which had been arranged for early December, a written response to the questions the LLF asked of the GCP at its 11 September 2017 meeting.
  - b. A written response to the LLF's additional concerns about each of the proposed sites, voiced at its meeting on 31 October 2017.
  - c. Further potential sites to be brought forward together with an explanation as to why other sites around junction 11 had been rejected.
  - d. That officers provided data and modelling on the impact of the new Cambridge South rail station and the potential effect of increased parking provision further south along the A10 for example at Foxton station, in relation to the number of parking spaces projected to be needed around the M11 in 2031.
  - e. Where commuters were travelling to in addition to where they were coming from to be considered to enable informed community feedback to be given on the required size and location of park and ride provision at junction 11.
3. **Connectivity at junction 13-** The LLF did not believe that it was sensible to decide the alignment of the Cambourne to Cambridge busway first. The LLF had passed a resolution, believing that connectivity of a Western Orbital bus service to Cambourne to Cambridge services was of key importance. End to end journey times and journey quality from west of Cambridge settlements to key employment sites such as the Cambridge Biomedical Campus, were a critical factor in judging the benefit of these schemes, to allow proper evaluation of cost/benefit ratio. The LLF requested that robust end-to-end journey metrics to destinations such as the Biomedical Campus, Science Park and city centre was published as soon as possible to enable respondents to the A428 consultation to make informed

responses.

In response to the LLF's concerns, the Interim Transport Director advised that all the issues raised by the LLF Chairman, would be addressed at the meeting that had been organised to take place in early December with the Executive Board's Transport Portfolio Holder.

Members of the public were invited to ask their questions (see appendix A). A written response would be provided to Sunanda Billur who had been unable to attend the meeting.

The Interim Transport Director presented the report which summarized the technical work carried out on assessing future demand for park and ride spaces at junction 11 of the M11 and a park and cycle facility at junction 12 of the M11. It also considered the issues associated with access to expanded park and ride facilities and the interaction with the local and strategic road network.

The Executive Board was informed that:

- The economic justification for a park and cycle facility at junction 12 could not be seen however following the feedback from the Joint Assembly which at its November 2017 meeting had expressed disappointment that park and cycle was not being taken forward, potential sites for an experimental park and cycle were being looked into. These were sites with existing parking facilities that could be used during the week. The owner of a potential site for this on Barton Road, had approached the GCP. This would be brought back to the Executive Board for a decision to be made at a future meeting.
- The Hauxton side of the M11 was being considered for a potential new park and ride site as this was as per the County Council's local transport plan which had been adopted by the Mayor. This identified the west of the M11 as the preferred site. The County Council had not pre-determined the site and although officers considered this to offer the best strategic fit, it was open to debate and discussion through the consultation forum, the first meeting of which would take place before Christmas 2017. The east side of the M11 was not being considered; this was not in the local transport plan.
- A consultation group would be set up to include all parish councils in the area and the local members.
- The full outline business case would detail the likely cost of the scheme, cost/benefit analysis, access to the site, its potential environmental impact and mitigations and feasibility of the scheme. Full environmental impact assessment would be carried out at the next stage. Subject to approval of an outline business case, public consultation would be carried out which would include all information regarding all potential options, the implications of these and the costs of these.
- Regarding car access to the site, one possibility was a new slip road off the M11 (northbound) going under the A10 and into the site. A potential option for buses to enter/exit may be via the agricultural bridge. Any public consultation would clearly set out the possible car/bus entry/exit.
- Meetings would take place with all parish councils with facilitated workshops as required.
- If the Executive Board decided that an outline business case was to be carried out, this would be brought to the Executive Board for consideration in March 2018.
- The agricultural bridge could take the weight of traffic; this had been checked with Highways England.

The Executive Board **AGREED** unanimously to:

- i. Proceed with a full outline business case for a new park and ride site west of junction 11 of the M11 and associated access/bus priority measures North West, as outlined in appendix 1 of the report. The Park and Ride site to be based on the emerging Travel Hub concept.
- ii. Not proceed with park and cycle at junction 12 of the M11 for the reasons given in the report but **AGREED** to the identification of a pilot park and cycle scheme which has the potential to be expanded if successful.
- iii. Remove the remit for junction 11 from the Cambourne to Cambridge Local Liaison Forum and approve the setting up of a site specific consultation group.

## 8. HISTON ROAD

Councillor Mike Todd-Jones, Chairman of the Histon Road Local Liaison Forum, was invited to speak. He gave an overview of the LLF's resolutions which were detailed in the appendix to the officer report for this agenda item, and thanked officers for their support of the process from which these had resulted. The LLF was supportive of a holistic approach to the redesign of junctions along Histon Road and recognised the capacity and physical constraints of the road in terms of what could be achieved.

Referring to this agenda item, Phil Allmendinger informed the Board that he was a resident of Gilbert Road.

The Interim Director of Transport presented the report, which was discussed by the Executive Board who raised the following points:

- The Executive Board acknowledged the concern expressed by the Joint Assembly regarding Histon Road.
- The Executive Board was informed that following preliminary analysis of the scheme, the cost/benefit ratio was positive. Officers were confident that improvements to public transport along the road could be made while maintaining cycling provision.
- A final concept design would be developed and consulted on in June or July 2018. The Chairman asked for the public consultation to be launched before summer 2018 if possible.
- Executive Board members indicated support for the proposals and recognised that there was not the space along Histon Road for an uncontested major intervention.
- Executive Board members supported the improvement of cycling infrastructure on Histon Road, advising that this was a major cycleway across the city to the guided busway but that it was a dangerous cycle route in its current format due to the width constraints of the road.
- The proposals offered benefits for local residents as well as significant benefits for the wider transport network.
- There were four schools around Histon Road, with children using the roads leading to it. Concern was expressed for the safety of these children cycling, as well as for commuters. The LLF was encouraged to engage strongly with these schools.
- It was felt that parking needed to be addressed in the southern part of the road.
- The Executive Board thanked the LLF for their work.

The Executive Board **AGREED** unanimously:

- i. To note the Histon Road Local Liaison Forum resolutions set out in Appendix 2 of the report and agree the responses set out therein and the resultant actions set out

in Section 4.

- ii. That officers should work up and model a revised concept design for Histon Road that aimed to provide bus priority through softer measures and which went further to provide improved cycling and pedestrian infrastructure, to be brought back for Board approval in March 2018.
- iii. To note the next steps in project delivery set out in paragraph 6.1 of the report.

## 9. QUARTERLY PROGRESS REPORT

The Chairman invited Edward Leigh, Dr Ashley Easter, Sambor Czarnawski-Iliev, Cllr Susan van de Ven and Dr Michael Prior-Jones to ask their questions. Details of the questions and a summary of the answers given are set out in Appendix A to the minutes. Dr Easter was not present at the meeting so would receive a written response to his question.

The final section of the A10 Cambridge to Royston cycleway was discussed:

- Clarity was needed regarding what Hertfordshire County Council was prepared to contribute to the project to complete the cycleway, with joint working required between Cambridgeshire and Hertfordshire County Councils to deliver this.
- The Executive Board was informed that the remaining part of the cycleway crossed the A505 and required a path to reach the A505 and a bridge to cross it to be delivered at the same time. Hertfordshire County Council had carried out a feasibility study for a new bridge and had said they would commit to lifetime maintenance of a bridge once constructed.
- A business case needed to be presented by officers to the Executive Board before a decision could be made. The Executive Board's Transport Portfolio Holder suggested a joint outline business case be developed by Hertfordshire and Cambridgeshire County Councils.
- The Interim Chief Executive advised that as the GCP was already over committed on tranche 1 funding, this project could not be delivered as part of this. It was advised that a business case be developed for the GCP's consideration for its future investment strategy.
- The Executive Board was advised that the Local Enterprise Partnership was supportive of greenways and other cycling schemes and that this project was an opportunity to allow expansion and growth of the area by enabling skills to be brought into it through the use of a cycleway.

The Interim Chief Executive presented the quarterly progress report and informed the Board that central government had confirmed an accelerated timeline for the delivery of Cambridge South Station.

Cambridge South Station was discussed by the Board:

- The Vice Chairman expressed disappointment at the lack of clarity from central government regarding East/West rail and expressed concern regarding their commitment to the delivery of Cambridge South Station.
- The Interim Chief Executive informed the Board of central government's announcement regarding Cambridge South Station and advised that there was commitment to deliver this. The Board was informed that the Department of Transport would lead on the development phase of Cambridge South Station. A legal agreement was to be signed regarding how the GCP was working with the Department of Transport to deliver it.
- The GCP's Transport Portfolio Holder advised that clarity was needed regarding

whether Cambridge South Station sat separately from East/West rail and that one organisation should deliver Cambridge South Station. The Interim Chief Executive advised that the development phase would provide clarity regarding this.

The Park and Ride Subsidy was discussed:

- The Interim Transport Director informed the Board that since the County Council had introduced the park and ride parking charge, usage of the park and ride had dropped by 14%.
- The Board was informed that the £10 overnight parking charge would remain, to deter long-stay parking.
- Board members expressed support for the proposal however the Vice Chairman advised that this should not be an open ended commitment and should be limited to three years. The Vice Chairman proposed the recommendation be amended to specify a three year timescale to enable funding to be reviewed. This proposal was discussed by Board members and advice was sought from Cambridgeshire County Council's Director of Finance. The Board was advised that regardless of whether the recommendation was amended to specify a timescale, the GCP would review all resources and funding allocations before moving into phase two at the end of 2021.

The Vice Chairman proposed the recommendation be amended to:

'Agree to allocate 50% (£531k) of the lost annual income resulting from the removal of the £1 parking charge at Park and Ride sites in the GCP area, from 1<sup>st</sup> April 2018, and review this at the end of tranche 1.'

A vote was taken on the proposed amendment; and all Executive Board members voted in favour of this, which became the substantive recommendation.

The Girton Interchange was discussed:

- In relation to this, the Transport Portfolio Holder informed the Board that he was chairman of the central section of East/West rail.
- The Board was informed that the Transport Portfolio Holder would be attending an Oxford to Cambridge stakeholder group meeting, on 15 December 2017.

The Cambridgeshire Rail Study was discussed:

- The Board was informed that a £300,000 study had been commissioned with Network Rail. The study covered the area stretching between Stansted North junction, Ely, Chippenham and Meldreth.
- The Vice Chairman expressed concern regarding the capacity of these lines to accommodate additional stations, advising that Network Rail had been found to be resistant to new stations. The Interim Transport Director advised that additional stations would be considered.
- The Transport Portfolio Holder expressed support for the recommendation however was concerned regarding the sufficiency of the area to be studied, advising that Bury St Edmunds and Norwich should be included.
- The Executive Board asked the Interim Transport Director to seek clarification from the Department of Transport regarding the geographical area and additional stations.

The Vice Chairman would raise the role of rural exception sites in South Cambridgeshire in relation to the provision of affordable housing, at his next Housing Portfolio Holder meeting.

The Vice Chairman requested fuller financial analysis in March 2018 regarding core funding from the government.

A financial monitoring update would be circulated to Executive Board members and added

to the agenda for the next meeting.

The Board was informed that electric vehicle charging points would be installed between 2018 and 2022. The Interim Chief Executive would clarify how many were to be installed and by when.

The Executive Board **AGREED** unanimously:

- i. To ask Cambridgeshire and Hertfordshire County Councils to undertake a joint study for the completion of the final stretch of the A10 Cambridge to Royston pedestrian and cycle route, to feed into the GCP's future investment strategy prioritisation process.
- ii. To make up to £1.75M contribution to the development phase of Cambridge South Station, with up to £8.25M from other national and local partners.
- iii. To allocate 50% (£531,000) of the lost annual income resulting from the removal of the £1 parking charge at park and ride sites in the GCP area, from 1<sup>st</sup> April 2018 and to review this at the end of 2019/2020.
- iv. To commission a feasibility study into upgrading the Girton Interchange and to allocate up to £100,000 towards the cost of the study.
- v. To make a £50,000 contribution to a feasibility study into rail capacity in Cambridgeshire, in partnership with Network Rail, Cambridgeshire County Council and the Combined Authority.
- vi. That new financial pressures would be built into the budget.

## 10. DATE OF NEXT MEETING

Mark Reeve informed the Board that this would be his last public GCP meeting as he was standing down as Chairman of the Local Enterprise Partnership on 19<sup>th</sup> December 2017. The LEP Board meeting on 19<sup>th</sup> December his replacement. The Executive Board thanked Mark for his valuable contributions to it representing the business community, which had been gratefully received.

The Executive Board **NOTED** that the next meeting would take place on Thursday 8<sup>th</sup> February 2018 in the Council Chamber at South Cambridgeshire Hall, Cambourne.

---

**The Meeting ended at 7.25 p.m.**

---

**Appendix A to the Minutes of the Executive Board meeting held on 22 November 2017 – Public Questions and Answers**

No.	Questioner	Question	Response
7a	Janet Lockwood	<p>I agree with the need to persuade as many people as possible to use public transport rather than private car to Cambridge destinations.</p> <p>Please would the Board consider changing its basic plan from bus to the more sustainable train where-ever possible? - that is, away from Park and Ride sites near the City to rail stations further out?</p> <p>It is clear from the Assembly vote that opinion is completely divided over Recommendation 1. Before preparing a Full Outline business case for 2000 new Park and Ride spaces near junction 11 for which there is no site without significant harm - please would the Board investigate other options, particularly rail which I think is a late starter in these studies?</p>	<p>Parking at rail stations and park and ride have different constrains as rail parking can only be located at rail stations where as the Chartered Institution of Highways and Transportation (CIHT) Park and Ride Guidance Note (18th February 2016) states that 'Sites should ideally be located on or adjacent to the strategic road network or on radial routes'.</p> <p>However, the GCP also has a paper planned on the development of the level crossing bypass scheme at Foxton that could also provide additional car parking within its scope. This paper is expected to be received at the February 2018 Executive Board.</p> <p>For clarity the Joint Assembly vote was more about the location of the site, i.e. expanding the existing Trumpington site or a new site at Hauxton. There was unanimous support for the provision of additional park and ride capacity.</p>
7b	Jane Ward, Chair of Hauxton Parish Council	<p>I am most concerned that there has been insufficient modelling of the traffic flow along the A10 from Foxton through Harston to junction 11 of the M11. In particular has a survey been done of the peak time A10 traffic through Harston to the junction 11 roundabout? Has modelling been done to show the effects on the A10 when the new Hauxton Meadows exit opens? Have the possible impacts on this traffic by a new P&amp;R been assessed?</p> <p>I believe all these will have a severely detrimental impact on the flow of traffic along the A10 through Harston, plus, there is a great chance that commuters living in Barrington and Haslingfield may also decide to make use of this P&amp;R rather than the Madingley P&amp;R attracting even more traffic along the A10.</p> <p>Please would the Board not rush into making a hasty decision and consider all the above points?</p>	<p>Modelling has been undertaken in terms of P&amp;R impacts including Local Plan sites and existing development sites. This modelling has considered the impacts on the A10 of a future P&amp;R at J11 west including the impacts of a new access point on the A10 close to the existing M11 junction.</p> <p>This modelling is being shared with Highways England to gain their views. The modelling demonstrates that congestion will be a concern in 2031 based on current growth projections and modelling assumptions for housing and jobs and that P&amp;R will form a key part of mitigating that issue.</p> <p>The direct marginal impact of the P&amp;R itself on congestion along the corridor is not significant and any impact must be weighed against the overall impact of congestion on key destinations if vehicles are not intercepted en-route.</p> <p>A stakeholder group involving all the affected Parish Councils together with local councillors is to be formed. This will enable full involvement in the development process. The first meeting of this</p>

**Appendix A to the Minutes of the Executive Board meeting held on 22 November 2017 – Public Questions and Answers**

			group will be held by the end of this year.
7c	Sunanda Billur	<p>My name is Sunanda and working in Addenbrokes hospital. My question: is there any direct transportation from Cambourne to Biomedical Campus (Addenbrooke's or Rosie Hospital)? Please note that Papworth is going to move to Biomedical Campus. So many people from Cambourne and surrounding village people will work in the hospital and have their appointments. Direct Bus facility will be more beneficial to all. So, everyone no need to take the car. Please consider the request and do the needful.</p>	<p>The GCP has 2 projects that cover this geographical area, the Cambourne to Cambridge better busways and the Western Orbital. The 2 projects combine in study area to cover a public transport route from Cambourne to the CBC site. Currently the Cambourne to Cambridge better busways has an interface where options for an ongoing bus service from Cambourne to CBC could either run on the M11 or off line to the existing Trumpington Park and Ride where further off line infrastructure runs directly to the CBC site.</p> <p>In addition exploratory discussions are currently underway with CBC stakeholders regarding the possibility of some additional bus provision.</p>
9a	Edward Leigh	<p>Park &amp; Ride parking charges The Economy &amp; Environment Committee received a report from officers in February 2017 that set out clearly why forfeiting £1.2m/year of income is inadvisable. The £0.53m/year with which the Board could decide to compensate the County Council will not create any new bus services; it will not extend services that currently end too early; it will not increase the frequency of any services; and it will not make bus services more affordable. So, I ask the Board:</p> <ol style="list-style-type: none"> <li>1. Where is the analysis showing that removing the P&amp;R parking charge is a more cost effective use of public funds than, say, subsidising extensions to P&amp;R and rural bus services?</li> <li>2. Where is the social impact analysis – in particular recognising that P&amp;R competes with rural bus services, on which our poorest and least able citizens depend?</li> <li>3. By how much is peak-time traffic forecast to reduce as a result of this intervention, (at one and two sigma confidence levels)?</li> <li>4. For how many years is GCP proposing to</li> </ol>	<p>1) The £1 parking charge at Park and Ride sites was introduced in 2014 as part of a range of proposals in the County Council's Business Plan for that year. Following the implementation of the charge, there was an immediate drop in usage of the services by around 14% and there was considerable public criticism over the difficulty of using the ticket machines and the charge itself. So although there may well have been some other factors at work, it does seem quite clear that use of the park and ride fell as a direct consequence of the charge. It was expected that passengers would return to the system over time, but in fact there has been a further decline in usage since the charge came in.</p> <p>2) Park and Ride is a really important part of the mix of access to Cambridge City. It still carries in excess of 3m passengers every year and is as important for commuters as it is for shoppers. This will become increasingly the case as further Residents Parking Zones are introduced, limiting the opportunities for on street parking, and congestion continues to be a problem in Cambridge.</p> <p>3) It is therefore really important that as these measures come in there is a real and attractive alternative for commuters and shoppers to access Cambridge. It is for that reason that the County Council and GCP are jointly proposing to remove the</p>

**Appendix A to the Minutes of the Executive Board meeting held on 22 November 2017 – Public Questions and Answers**

		<p>subsidise parking at more than £0.5m/year? Why is this not stated in the background paper?</p> <p>5. Will the Board confirm whether overnight parking will still be charged at £10/night?</p> <p>6. How confident is the Board that this decision will withstand judicial review?</p>	<p>charge, a move which is expected to be near universally welcomed as it will also simplify the process of travel by removing the need to enter car registration numbers to the ticket machines. There has been no detailed analysis of the impact of the reduction in the charge, but suffice to say, given that the introduction itself resulted in a loss of patronage, it is a fair assumption that as the system becomes easier and typically up to 25% cheaper to use, passengers will return, thus reducing congestion and pollution on the streets of Cambridge.</p> <p>4) In terms of the detail of this question, the proposal is for an ongoing joint cover of the costs of park and ride between the County Council and GCP although clearly for GCP, that depends on the ongoing funding being secured from Government which is expected.</p> <p>5) The £10 overnight charge will remain as it is necessary to ensure that the sites are not used for long stay free parking given the vital role they play in access and the economy of the Greater Cambridge area.</p> <p>6) If we follow correct procedure and process as we believe that we are and hope to continue to do so, then we will withstand any external scrutiny including judicial review.</p>
9b	Dr Ashley Easter	<p>I am a former resident of Cambridge, now living in Royston, and I cycle between the two frequently as well as to my place of work in Melbourn (AstraZeneca, in future at Addenbrooke's). This last June on the A10 near Melbourn (where there is no cycleway) I was struck by a car, luckily escaping with only moderate injuries.</p> <p>After the accident, whilst using the excellent cycleway from Melbourn to reach my Physio in Cambridge, it struck me that despite the hard work by a number of councillors, volunteers and local bodies, as well as detailed plans being in place,</p>	<p>Firstly thank you to everyone for submitting their questions, and for coming to the meeting today, particularly to Sambor for the survey work he has undertaken amongst fellow students.</p> <p>Cambridgeshire County Council and the Greater Cambridge Partnership have each funded various sections of the Cambridge to Melbourn A10 cycle route, and this is now well used and well received. As the questioners point out it is possible to extend the route further south to the town of Royston.</p> <p>A new foot and cycle bridge over the A505 would be needed, estimated at £2m. One side would land in Hertfordshire. Planning consent and one small plot of land would be required. To reach the</p>

**Appendix A to the Minutes of the Executive Board meeting held on 22 November 2017 – Public Questions and Answers**

		<p>commitment for the final stretch was still uncertain.</p> <p>Please can the Greater Cambridge Partnership do everything in their power to complete the Cambridgeshire part of the A10 cycleway scheme, extending the existing cycleway from Melbourn to Royston, before anyone is more seriously hurt?</p>	<p>bridge, a new path on the east side of the A10 would be required. This would be wholly in Cambridgeshire, and would cost around £1m to deliver.</p> <p>Delivering the path in isolation without a bridge would not realistically be possible on safety grounds, as people would be encouraged to use the new path only to find that there was no way of safely crossing the A505. The two scheme elements should be delivered together, though it is possible that different funding bodies could fund different elements.</p> <p>In terms of funding, Hertfordshire County Council (Herts CC) have funded a feasibility study on a new A505 bridge, as well as committing to lifetime maintenance costs of the bridge, which they estimate at £500,000. GCP officers have discussed the project with Herts CC further, and Herts CC have confirmed that linking Royston with Melbourn for non-motorised users is not a high priority to them, and they feel that their feasibility study and offer of maintenance is as much as they are prepared to offer.</p> <p>Royston lies geographically in two Local Enterprise Partnership (LEP) areas (Hertfordshire LEP and Greater Cambridge Greater Peterborough LEP). LEPs are able to bid for local Growth Deals and have access to funding for capital projects.</p> <p>I understand that Royston Town Council have committed £30,000 towards the project, and four individual businesses have each indicated that they would also contribute £30,000 each.</p> <p>Royston is a town (15,781 population) and Melbourn a large village (population 4,725), both with a range of employment sites, educational establishments, leisure facilities, shops and services, for which logically there are many reasons for people to want to make journeys between the two settlements by non-motorised means. Currently most of these journeys are done by car.</p> <p>The narrative of future usage and improved safety needs to be weighed up with the fairly significant cost of £3m to provide both a new path and bridge, and thus more work will be done on the</p>
--	--	---	--

**Appendix A to the Minutes of the Executive Board meeting held on 22 November 2017 – Public Questions and Answers**

			business case, and further discussions with Herts CC. This will then allow an informed decision to be made to either fully or partly fund the scheme, or not to fund the scheme.
9c	Sambor Czarnawski-Iliev	<p>Hello all! I am Sambor, a Year 9 student from Melbourn Village College. Last May I got involved with the A10 cycling campaign, and began a survey which was completed by 62 students, to find out how much support there is for cycling to school.</p> <p>The results were pleasing, as you can see on the sheet we've given out. The survey also showed that the lack of a safe route for cyclists along the A10 between Royston and Melbourn hindered quite a few students from being able to cycle to school. I am here to ask for your support in funding that path. I would be delighted in also giving you a first-hand tour of the route.</p> <p>The College itself has dozens of students from Royston. This number has been increasing at an ever-faster rate over the last few years, and with the planned housing developments, it's bound to keep increasing. Most of the ones I know will be glad to use such a path.</p> <p>My whole family travels by bike, virtually all the time, virtually everywhere. A path like this will open up a much-needed link between Hertfordshire and Cambridgeshire.</p>	Please see the answer for question 9b
9d	Cllr Susan van de Ven	<p>With a modest investment, the final link in the Cambridge-Royston cycle scheme could be quickly completed within the GCP Tranche 1 timeframe. The two-mile Melbourn-Royston link needs a path in Cambridgeshire and a bridge in Hertfordshire.</p> <p>This is a shovel-ready project that would deliver significant economic benefits, and make a</p>	Please see the answer for question 9b

**Appendix A to the Minutes of the Executive Board meeting held on 22 November 2017 – Public Questions and Answers**

		<p>substantial contribution to reducing reliance on the private car for travel to key areas of employment in Cambridge and along the A10 corridor from Royston. It will maximise the benefits of the investments in this route already made by GCP. Because it has the potential to be delivered within the existing GCP funding period, it can demonstrate real progress on innovative, economically led schemes to Government.</p> <p>Today, I am here to ask for your support just for the path in Cambridgeshire. This has been costed at £1 million. While Cambridgeshire County Council has no funding to offer, the GCP is ideally placed to make this happen.</p> <p>You will want to know what’s happening on the Hertfordshire side for bridge funding. Following the LEP’s indication of support on a collaborative basis, Herts County and Royston Town Councils, local businesses including AstraZeneca, and many small private donations are coming together to create a funding package.</p> <p>That this overall effort has persisted for so long is really down to commuters who want to leave their cars at home. As the owner of Melbourn Science Park said to the GCP Board last year, this sustainable transport link will not only alleviate pressures on Science Park parking, but will allow the creation of more jobs.</p> <p>So, today we are asking the Board to get fully behind the project, by proposing that the GCP commit the necessary funds to complete the Cambridgeshire portion of the scheme.</p>	
9e	Dr Michael Prior-Jones	The Quarterly Report notes that the Shepreth to Melbourn section of the A10 Cambridge-Royston cycle route opened in March, and came in slightly under budget. I would like to thank the board for	Please see the answer for question 9b

**Appendix A to the Minutes of the Executive Board meeting held on 22 November 2017 – Public Questions and Answers**

		<p>funding this part of the route, and ask them to seriously consider funding the proposed path from the south end of Melbourn to the A505. This would be as part of a package with a bridge over the A505 to Royston, with funding from several other agencies and private businesses. The total cost of the project is estimated at £2.5m.</p> <p>I work at a firm on the Melbourn Science Park. I have around 25 colleagues living in Royston, who make the two mile journey to work by car because it is not safe to cross the A505 - and there are plenty more working in the other businesses on the park. Our business is expanding and we are creating more jobs in Melbourn. The high cost of housing in Cambridge and South Cambs means that even young professionals on good salaries are struggling to buy homes in Cambridgeshire. More of our staff are choosing to live in Royston, where housing is fractionally cheaper, and the lack of safe routes to walk or cycle to work means that we are generating a lot of short-journey commute traffic and demand for car parking on our site.</p> <p>It reflects poorly on the structure of our local government institutions that the county boundary causes so many issues with the funding. I would urge the board to support this proposed scheme, and find ways to resolve the issues over the border with Hertfordshire, because it will help us create jobs, retain staff, and produce a better quality of life and health for both our staff and the wider community.</p>

# Agenda Item 6

**GREATER  
CAMBRIDGE  
PARTNERSHIP**

Growing and sharing prosperity

Delivering our City Deal

**Report To: Greater Cambridge Partnership Executive Board**

**08 February 2018**

**Report From: Councillor Kevin Price, Chairperson of Greater Cambridge Partnership Joint Assembly**

---

## **1. Overview**

- 1.1. This report is to inform the Executive Board on the discussions at the Joint Assembly held on Thursday 18<sup>th</sup> January 2018, which the Board may wish to take into account in its decision making.
- 1.2. Two questions were received from members of the public, both of which were taken with the Rural Travel Hubs item.
- 1.3. Four reports were considered and the Joint Assembly also heard a presentation from Steer Davis Gleave on the conclusion of the Rapid Mass Transit scheme options appraisal. The Joint Assembly also heard a presentation from Systra on the Residents Telephone Travel Survey report that formed a part of the item reporting back on the findings of 'Our Big Conversation.'

## **2. Cambridge Autonomous Metro (CAM)**

- 2.1. The Joint Assembly welcomed the opportunity to hear the presentation from Steer Davies Gleave (SDG) and there was enthusiasm from many of the Joint Assembly members who delighted to hear about an ambitious and progressive proposition.
- 2.2. However, a few members of the Joint Assembly wanted to wait for the full report before making a judgement. Similarly, they raised a concern about the presentation not being published in advance and about media coverage the topic had received.
- 2.3. The Joint Assembly members had many technical questions for the representative of SDG which were answered during the course of the debate. There were some questions about the scheme operational costs and whether it would be able to operate without subsidy.
- 2.4. There was also general agreement for there to be a significant interplay with existing infrastructure, and the Joint Assembly were very keen that transport requirements need to be considered carefully so that when this scheme is fully functional it should not have an economic or user affect on other forms of transport or areas of the county.

### **3. A10 Foxton Level Crossing Bypass and Travel Hub.**

- 3.1. The Joint Assembly was pleased to see Foxton Crossing back on the agenda and agreed with the overall approach recommended to the Executive Board, though there was a strong appetite amongst many of the Joint Assembly for Network Rail to make a significant contribution to costs.
- 3.2. Members of the Joint Assembly questioned whether the number of car parking spaces previously proposed was enough.
- 3.3. Some Joint Assembly members questioned the links with other schemes that needed to be made explicit, such as the cycleway along the old train line, both safe and more cycle parking in the vicinity of the station, and the integration with East/West rail proposals. The Joint Assembly acknowledged that a number of schemes interact in the vicinity and the solution needs to take all of these into consideration.

### **4. Cambridge to Ely A10 study**

- 4.1 The Joint Assembly provided a range of views upon viewing this report, with some of the members disappointed that it had been perceived as a road centric scheme that had not looked at all other available options, whilst other members welcomed the prospect of focusing more on the north of Cambridge and the opportunities that the scheme provided for long distance cycle ways.
- 4.2. The Joint Assembly also discussed how the success of the scheme in achieving modal shift was reliant on better Park and Ride facilities to the north of Cambridge, including Waterbeach train station, and that this needed to be carefully considered particularly the interplay between the public transport proposal in option one and rail.
- 4.3. The Joint Assembly endorsed the recommendation to the Executive Board to pass this scheme onto the Combined Authority to deliver but felt that the Greater Cambridge Partnership was well placed to deliver the modal shift opportunities that option 1 in section 5.1 could bring.
- 4.4. This discussion concluded in a suggestion that the Executive Board may wish to consider an additional recommendation to make this offer to the Combined Authority.

### **5. Our Big Conversation**

- 5.1. The Joint Assembly were very appreciative of the significant amount of work that has been undertaken by officers to achieve the volume of information provided and the helpful way that it was presented to the Joint Assembly, and looked forward to being able to make decisions based on evidence going forward.
- 5.2. Members of the Joint Assembly expressed concern that the four of the top five incentives to encourage modal shift related to bus services where the Greater Cambridge Partnership has no specific influence, suggesting that the Mayor should have sight of the reports to inform the bus review that he is conducting. However, it was explained that improving the quality of public transport corridors, as per the GCP objectives, would address many of the concerns expressed.

**5.3.** Some members of the Joint Assembly hoped that the intelligence on some of the so called 'sticks' such as intelligent charging would embolden the Executive Board to give careful consideration to these as a mechanism to achieve the aspiration of better public transport services, whilst other members of the Joint Assembly did not want the issue of affordable housing to be lost.

## **6. Rural Travel Hubs**

**6.1.** There was a mixed response from the Joint Assembly to the approach recommended to the Executive Board with a few members not in favour, whilst others endorsed the sites proposed.

**6.2.** Some of those who were opposed to the approaches stated that they were worried about the conflict between achieving GCP objectives of reducing congestion and modal shift, balanced with the impact on local parishes who might see more traffic in their villages. Other members expressed concern about the rural travel hubs becoming free car parks for specific stations, the temporary approach of rural travel hubs, and that they perceived them to have no benefit for local residents.

**6.3.** Those members of the Joint Assembly in favour of the approaches felt that there were many positives proposed and that some villages were aware of the risks but also welcomed the potential to become a modal interchange that will benefit neighbouring villages. It was acknowledged by some members that no solution was ever going to be perfect, but there was also a feeling that sometimes there was a need to try out different things to see their impact.

*End of Chair report*

# Agenda Item 7

**GREATER  
CAMBRIDGE  
PARTNERSHIP**

Growing and sharing prosperity

Delivering our City Deal

**Report to:** Greater Cambridge Partnership Executive Board

08 February 2018

**Lead officer:** Chris Tunstall - GCP Interim Transport Director

## **Mass Rapid Transport Strategic Options Appraisal**

### **1. Purpose**

- 1.1. In July 2017, the Board together with the Combined Authority Board approved the commissioning of a strategic options appraisal to investigate potential mass rapid transit solutions. This study has now been concluded, and has established that there is a strong case to develop this initiative further.
- 1.2. The report sets out the key findings from this study and updated the Board on the next stage to develop a Strategic Outline Business Case for a Cambridgeshire Autonomous Metro (CAM) proposal. The report also considers how the current schemes provided by the Greater Cambridge Partnership, can transition to form part of the proposed CAM network.

### **2. Recommendations**

- 2.1. The Executive Board is recommended to:
  - a) Welcome the findings of the Cambridgeshire Mass Transit Strategic Options Assessment;
  - b) Agree that the findings be commended to the Combined Authority with a view to developing a Strategic Outline Business Case;
  - c) Agree that the Greater Cambridge Partnership builds on the Mayor's plans for the next stage of developing a CAM Metro network by ensuring GCP's current and future plans for high quality public transport corridors are consistent and readily adaptable with the emerging proposition (subject to the future business case for CAM being agreed by the Combined Authority).

### **3. Key issues and considerations**

#### **Scope of the Mass Rapid Transport Study**

- 3.1. The study area included Greater Cambridge and the surrounding economic and geographic travel to work areas.
- 3.2. The primary purpose of the study was to evaluate and recommend the most appropriate mass transport solution in order to support the following aims:
  - (a) Support economic growth – recognising the critical significance of the Greater Cambridge economy for the area as well as for the UK
  - (b) Improve accessibility and connectivity across the City to boost economic growth and prosperity
  - (c) Address current congestion and delays, and build intelligent mobility within Cambridge City and the rest of the transport/infrastructure network.

- 3.3. It was recognised that any mass rapid solution should be underpinned by a number of key principles. It must:
- (a) Deliver a high quality, high frequency, reliable service to be attractive to encourage mode shift
  - (b) Deliver maximum connectivity, network coverage and reliable journey times
  - (c) Provide sufficient capacity for future growth
  - (d) Be flexible to adapt for the future including the adoption of emerging technologies
  - (e) Represent value for money, and be affordable and deliverable.
- 3.4. The study was, therefore, wide ranging in its considerations. A comprehensive list of both traditional and emerging mass rapid transport modes were considered and evaluated. Importantly these were placed in the context of the region's vision for growth; the current and future transport constraints; network requirements encompassing key destination and development sites; and a range travel demand scenarios.

#### **Key findings from the Mass Rapid Transport Study**

- 3.5. The study (see background paper link) recognises the number of major transport schemes currently under development in the Cambridge area that will deliver significant benefits but that these solutions need to deliver seamless connectivity between the City Centre, key development sites on the City fringe and the wider corridors in the region.
- 3.6. The study concluded that there is a strong strategic case for mass rapid transport that could support the wider economy through:
- (a) Proximity effects – which creates closer concentration of businesses, skilled workers and academics, and improves productivity as they collectively benefit from each other's innovations, ideas and creativity
  - (b) Expanded labour markets – through the provision of a transport network that successfully connects workers to jobs, facilitating recruitment and enables businesses to grow
  - (c) Direct productivity impacts – by reducing travel time and increasing the efficiency and competitiveness of businesses
  - (d) Transport and social factors – by connecting people with jobs, services and leisure activities. Improving quality of life by providing greater access to more affordable housing, reducing congestion, improving air quality and improved health by encouraging walking at the beginning and end of journeys.
- 3.7. Given the likely constraints in terms of physical constraints on the network, congestion and the anticipated growth of the area, it is unlikely that the City Centre can accommodate significant increases in bus throughputs under the current bus configuration. Any significant increase is likely to be accompanied by increased journey times.
- 3.8. The study considered a long list of traditional and emerging mass transit solutions before shortlisting three options for more detailed evaluation. These included Light Rail Transit (LRT), Affordable Very Rapid Transit (AVRT), and Cambridgeshire Autonomous Metro (CAM). In the case of LRT and AVRT, the project team was able to draw upon the good work that had already been undertaken in developing these respective proposals. For clarity, each of these options are described below:

Light Rail Transit	This is a generic term for any railed vehicle lighter than a convention/traditional heavy rail solution. LRT operates on dedicated tracks and is segregated from other modes of transport. Vehicle capacity is circa 200 passengers and can operate a service frequency in excess of every ten minutes along each route
Affordability Very Rapid Transit	This consists of small rubber-tyred vehicles operating at high speed within a network of small single-bore tunnels. Vehicles operate with a capacity of approximately 40 passengers with a potential frequency in excess of 25 vehicles per hour. Services operate autonomously as a series of simple end-to-end shuttles.
Cambridge Autonomous Metro	<p>This represents an evolution of both LRT, AVRT and Bus Rapid Transit (BRT) type solutions. It operates using bespoke rubber-tyred articulated vehicles and can achieve vehicle frequencies of every five minutes during peak periods. This solution has the ability to operate on both segregated and existing on-street infrastructure.</p> <p>Due to the range of potential vehicle available for this solution, this option was developed on the basis of a high-quality, tram-like vehicle with a capacity of up to 100-200 passengers.</p>

Figure 1 – Illustration of CAM vehicle

3.9. Each option was assessed against seven transport and six deliverability risks as outlined below.

Transport Benefits	Deliverability Risks
Network coverage	Technical feasibility
Route flexibility	Technology
Frequency of service	Value for money
Journey time / reliability	Affordability
Number of interchanges	Powers / consents / legislation
Accessibility	Stakeholder / public acceptability
Perceived quality	

3.10. It should be noted that this evaluation framework was developed purely to enable an effective comparison of options. It is recognised that there are a wider range of additional factors which must be considered during the subsequent development of the mass rapid transit proposal and that existing conclusions must continue to be reviewed as the proposal gains definition. Once individual routes emerge this will demand detailed consideration of environmental impacts.

3.11. The outcome of this evaluation was that CAM offered the best overall solution without any significant dis-benefits. Importantly it offered the greatest route flexibility through its ability operate on both segregated and existing on-street infrastructure. As a result it had the potential to offer the greatest service coverage across all radial corridors. Perceived quality was also a major consideration and it was concluded that higher specification vehicles, as shown in Figure 1, would offer provide an excellent passenger experience especially along segregated routes.

3.12. Whilst CAM performed well on many of the transport benefits described above, it excelled when assessed against a range of deliverability risks. Of all the options considered, CAM is the most likely to achieve value for money and an operating surplus. This greatly increases the deliverability of the mass transit proposal and is most likely to achieve private sector investment.

3.13. The flexibility of CAM to operate on both segregated and existing on-street infrastructure also has further practical benefits in its implementation. Importantly, it enables the incremental provision of a segregated network to match growth requirements.

3.14. There are no technical feasibility issues with CAM although there are recognisable challenges, as there would be with the other options, in tunnelling and the provision of underground station. From a technology perspective CAM can use technology that is readily available and can transition from driver operated to autonomous technology as this matures.

### **Costs and funding**

3.15. The capital costs of implementing the CAM proposal is estimated to be in the region of £1.5-£1.7bn. This includes scheme development and design, implementation, project management, risk and (in accordance with the Treasury's Green Book) optimum bias.

3.16. Costs have been benchmarked from publically available data for similar transport schemes in the UK with due consideration of the scheme characteristics such as route length, tunnelling length, number of stations and number of vehicles. However, a significant expenditure relates to tunnelling, the extent of which will require greater development.

- 3.17. Whilst these capital costs are very significant there are a number of potential funding solutions which will be explored during the subsequent development of the scheme. What is clear is that central Government is increasingly looking for means through which major infrastructure can be (part or fully) funded from private sector and/or local contributions. It is too early to speculate on what the preferred funding model might be but it could include, amongst others, Land Value Capture, Community Infrastructure Levy and Business Rate Supplement.

#### **Impact on existing Schemes**

- 3.18. Existing schemes, such as Cambourne to Cambridge and the Cambridge South East Corridor Transport Study, create the opportunity to transition in the future to provide key parts of the CAM infrastructure. The SDG integrated network proposition is predicated on these planned interventions being part of the solution.
- 3.19. Discussions are currently being undertaken with our legal advisors as to the most appropriate way of transitioning the existing schemes and subsequently procuring the necessary approvals/ orders. The implications will be dealt with in future reports in respect of the individual schemes, subject to the Combined Authority progressing the detailed feasibility work for CAM. At this time it is not envisaged that this will delay the current programmes, but could potentially assist with early delivery of parts of a CAM network.

#### **Deliverability of the Cambridgeshire Autonomous Metro**

- 3.20. Based on the findings from the initial study it is recommended that the CAM proposal be commended to the Combined Authority be carried forward for further development with a view to developing a Strategic Outline Business Case. This proposal should:
- (a) Provide significant transport benefits to Greater Cambridge and the surrounding areas
  - (b) Offer the best value for money case despite its high capital costs
  - (c) Be deliverable in the practical sense, both in terms of technical and technological feasibility
  - (d) Run at a commercial surplus during operation which should ensure its long term viability.

#### **Next steps and milestones in the delivery of a mass rapid transport solution**

- 3.21. Whilst the existing study has concluded that CAM represents the best overall mass transport solution for the area, significant further work is required to develop the proposal and make a robust case for investment. Therefore, the next stages of the project will be to develop a Strategic Outline Business Case. The Combined Authority's Outline Scope for the next phase of work is shown at **Appendix 1**.

3.22. An outline delivery programme for this proposal is provided below. However, it must be recognised that the project is at a very preliminary stage in its development and any delivery timetable must be considered indicative only. Also, the outline programme relates to the City core element and it may be possible to bring forward the delivery of some of the wider routes if these can be incorporated into schemes which are already under development, as outlined in sections 3.18 and 3.19.

Activity	Completion
Strategic Outline Business Case Options Appraisal report	Late 2018
Outline Business Case Public Consultation	2019
Full Business Case	2020
Statutory Consents	2021
Design (City core)	2022
Construction (City core)	2026

3.23. At this stage it is not possible to provide a completion date for the overall CAM network. However, it is anticipated that the network will be developed in phases, focusing on the City core and those corridors with the greatest need.

3.24. The Strategic Outline Business Case will also effectively create an overarching strategy for the implementation of mass rapid transit for Greater Cambridge and the surrounding economic and geographic travel to work areas. Specific governance and delivery arrangements will be developed jointly with the Combined Authority as part of ongoing wider transport governance discussions.

#### **4. Implications**

##### **4.1. Financial and other resources**

There are no financial implications at this stage.

##### **4.2. Legal**

None at this stage

##### **4.3 Staffing**

Not applicable at this stage

# 1 Cambridge Autonomous Metro (CAM) – Next Steps

## Key Project Stages and Indicative Programme

- 1.1 The key stages of project development of the CAM concept to the start of construction are:
- Preparation of a Strategic Outline Business Case. The purpose of the SOBC is to identify the need for intervention, to develop options to meet locally developed objectives and outcomes and to sift to identify better performing options. The current work developing the CAM concept provides much of strategic rationale for intervention, but further detailed work to develop and apprise the concept, and public consultation on the concept and options, is required for SOBC. The SOBC needs to be accompanied by an Options Assessment Report (OAR). **We believe an SOBC can be developed within a c. 6-month timescale.**
  - Preparation of an Outline Business Case (OBC). This sets out the business case for the preferred option, based on the Treasury 5-Case model. The OBC includes a detailed assessment of costs, benefits and impacts, and detailed how the scheme would be funded, procured and delivered. The OBC provides the basis for conditional funding approval and includes much of the analysis to support a Planning / TWAO Inquiry. The OBC required substantive technical work, statutory and public consultation and detailed discussions with DfT. **A realistic timescale for OBC is for completion by the end of 2019/early 2020** (subject to further scoping needed in relation to DfT compliant transport models and extent of environmental surveys).
  - Post OBC activities
    - TWAO / Planning Inquiry preparation, submission and inquiry – 2020 / 2021
    - Procurement. This is likely to take a full 12 months from the Inquiry decision, unless procurement is undertaken at client risk in parallel to consents.
  - Full Business Case. The full business case is prepared after procurement has been undertaken, and scheme costs and funding are confirmed. Construction can commence after powers are secured. There would typically need a mobilisation phase of land acquisition, entry and preparation (for CGB we needed archaeological, species relocation and flood works for example then mobilisation works and then construction. Early works and mobilisation might be separate or part of main works contract depending on procurement strategy. **An indicative construction start would be 2023.**
- 1.2 The overall timescale is shown in the table below. The overall duration is a year longer than those set out in our draft report / presentations.

Figure 1.1 Indicative Programme

## **Suggested Next Step – Scheme Development and SOBC**

- 1.3 The current stage of work has established the need for investment, identified options and the opportunity for a CAM concept, and built stakeholder and political support for the proposal. The scheme is, however, an outline concept with much detailed work to be undertaken to understand in more detail alignments, stations and likely operating scope so that the project development costs, likely impacts of the scheme, capital cost estimates and options, operating and maintenance costs and funding requirements can be understood with more certainty.
- 1.4 To support the development of the OBC, and to provide through to Inquiry a multi-disciplinary team and expert advisors will be required. However, we suggest that the most appropriate next stage of work would be to commission the work required to support the SOBC, and as part of this work expedite key activities that would be required for the OBC in parallel given:
- the current scope of the project for more detailed engineering, environmental and assessment work is still broad and reasonably vague for going to market for advisors;
  - the larger procurement exercise of obtaining these advisors is likely to take some months and would provide a delay in the programme at a time when it will be important to demonstrate progress with key stakeholders;
  - a tighter project definition at the end of SOBC should reduce the expenditure risk on project development costs for the multi-disciplinary team (for example identification of a short-list of sites and designs for a city centre station).
- 1.5 Steer Davies Gleave could continue to support the development and specification of the workstreams and advice that could then form the basis of an OBC procurement exercise in the latter part of 2018. By this point, the nature and scope of advice required would become clearer and a Steer Davies Gleave led team could mobilise straight away and ensure that momentum is maintained and that no time is lost within the overall project timescale.
- 1.6 Within the timeframe of the SOBC, an SDG-led team would draw on specialist advice in key areas such as property, technology, legal, heritage etc. This advice could be provided either by consultants on CCC's existing frameworks, or through our network of specialist consultant with whom we have established relationships. SDG would ensure the advice was focused on the material issues required to support the SOBC, i.e. focused and specific.

## **SOBC Workstreams and Tasks**

- 1.7 The table below outlines the workstreams and high-level tasks that would be undertaken within the SOBC study.

Figure 1.2 SOBC Workstreams and Tasks

Workstream	SOBC Tasks	Outputs	Lead / support
Project coordination	<ul style="list-style-type: none"> <li>Coordination of workstreams incl. technical &amp; comms</li> </ul>	<ul style="list-style-type: none"> <li>Regular progress reporting to officers and Members (if required)</li> </ul>	<ul style="list-style-type: none"> <li>SDG could provide specialist project coordinator.</li> </ul>

## SOBC Outputs

1.8 The key outputs from the SOBC will be:

- A Strategic Outline Business Case. This makes the case for the scheme, and to justify progression to OBC.
- An Options Assessment Report. This provides the audit trail showing how options were developed to meet objectives, option assessment and the identification of preferred options for OBC. We anticipate the options for OBC will be a CAM preferred scheme

including a tunnelled city centre section, and a low-cost alternative which would be at-grade. Public consultation findings will inform the OAR.

- An Appraisal Specification Report (ASR). This sets out the approach to the OBC business case appraisal. The intention is that this would be agreed with DfT.
- An OBC work programme, which defines the workstreams, tasks and timescales for the development of an OBC. This will inform the development of a procurement exercise to secure the OBC project team.

### **Indicative Costs**

- 1.9 Our indicative estimate is that the overall budget for a 6-month programme to prepare an SOBC and associated deliverables would be £350,000 to £500,000. This includes the costs for the technical workstreams above but excludes costs for public consultation.

# Agenda Item 8

**Report to:** Greater Cambridge Partnership Executive Board

08 February 2018

**Lead officer:** Chris Tunstall – GCP Interim Transport Director

## **A10 Foxtton level crossing bypass and travel hub**

### **1. Purpose**

- 1.1. The list of priority schemes for support from the Greater Cambridge Partnership (GCP) was agreed at the Executive Board meeting of 28<sup>th</sup> January 2015. The A10 Foxtton level crossing bypass whilst not within the list of prioritised schemes, was included as a relatively high priority for future consideration within later funding streams. It is now being recommended for further development as part of the Future Investment Strategy.
- 1.2. Whilst the original scheme initially only considered a level crossing bypass the revised proposals will also consider a more extensive ‘travel hub’ with the provision of additional parking facilities to complement both our existing Park and Ride and Rural Travel Hub proposals.

### **2. Recommendations**

- 2.1 The Executive Board is recommended to:
  - a) Note the assessment work and review of the options presented in this report and Appendix 1
  - b) Approve the development of an ‘Outline business case’ for a preferred option.
  - c) Explore the opportunity for Foxtton Station to act as a Travel Hub with a Park and Ride facility for onward rail trips into Cambridge and Cambridge North stations, and the proposed, future Cambridge South station.

### **3. Officer comment on technical issues raised at Joint Assembly**

- 3.1. The Joint Assembly raised an issue concerning the level of car parking provision that could be provided as the Rural Travel Hub indicated approximately 40 spaces and the Network Rail 2013 GRIP 2 report proposed 85 spaces.
- 3.2. It was explained that the assessment of the scheme would be re-evaluated based on a Travel Hub and updated using the GCP objectives as opposed to the Network Rail considerations. The car parking will be looked at together with the bypass, not separately, as part of an integrated approach.

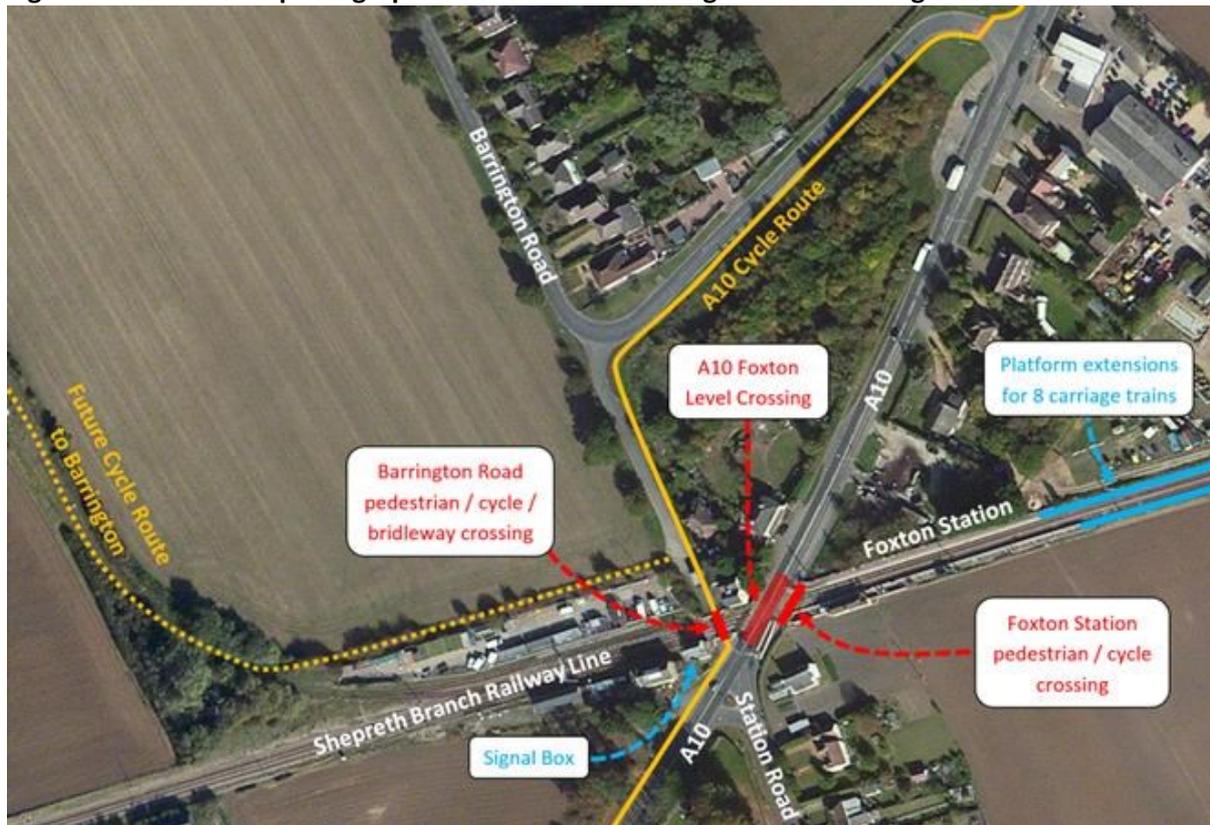

- 3.3. Questions were also raised about how this scheme would be integrated into the proposals in respect of East/ West Rail and Cambridgeshire Autonomous Metro (CAM), and other modes such as cycling together with the potential for other avenues of funding that might be looked into.
- 3.4. Officers responded confirming that the scheme would be developed taking other initiatives and investments into account. They also stated that cycling provision would be maintained in respect of the Barrington development requirement to provide a cycle link to the A10, and with cycle parking at the new Travel Hub. Officers assured the Joint Assembly that other organisations would be approached for funding such as Network Rail, East West Rail Consortium, and the Combined Authority depending on the scope of the works.
- 3.5. A question was raised regarding the emerging Foxton Neighbourhood Plan and that consideration should be given to this and the local community concerns about both visual impact and the impact on the conservation area which should be recognised as part of the study.
- 3.6. It was explained that these matters would be considered and that officers had already met the Parish Council and were aware of the emerging Neighbourhood Plan, the existing and proposed conservation area, as well as localised issues such as historically valuable buildings such as the signal box.

#### **4. Key issues and considerations**

##### ***Background***

- 4.1 At the point where the Cambridge to Royston railway line crosses the A10, there are three at-grade crossings of the track: one for the road, and two pedestrian / cycle / bridleway crossings. The road crossing causes significant congestion on the A10, particularly in peak periods. The A10 Foxton level crossing bypass scheme involves provision of infrastructure to enable the closure of the level crossing on the A10 to the immediate south of Foxton Station. The closure would be facilitated by providing a bridge or underpass for the A10 on a bypass alignment to the north west of the existing road. A pedestrian bridge or underpass at Foxton Station could also be provided as part of the scheme. Figure 1 below shows a plan of the current layout of the level crossing, some annotated constraints and future considerations.

**Figure 1 Aerial photograph of Foxton level crossing and surrounding area**

- 4.2 This report summarises technical work carried by Cambridgeshire County Council, on behalf of Network Rail in 2013 (Appendix A). It also considers the present strategic objectives of the GCP and reflects more recent considerations of the, ‘Cambridge to Royston cycle route’, Cambridge North Station, East West Rail, Cambridge South Station proposals and Hauxton Travel Hub (Park and Ride).
- 4.3 There is a clear policy background supporting a strategic improvement to the transport network in the A10 Foxton area, particularly in the context of local growth, safety and reductions in journey times and congestion on the A10. The Third Cambridgeshire Local Transport Plan (LTP) 2011-2031: Policies and Strategy A10 Foxton Level Crossing states that ‘a bridge or underpass across the railway, removing the conflict between trains and vehicular traffic, cyclists and pedestrians’ is expected to be delivered. The ‘scheme may also provide a new station footbridge or underpass, and improved interchange facilities’.
- 4.4 The Foxton level crossing bypass scheme supports many of the Greater Cambridge Partnership’s aims and objectives including:
- Easing congestion and making it easier for people to travel by rail, cycle or on foot to improving average journey times
  - Keeping the Greater Cambridge area well connected to the regional and national transport network, opening up opportunities by working closely with strategic partners
  - Reallocating limited road space in the city centre and invest public transport
  - Connect Cambridge with strategically important towns and cities by improving our rail stations and financing new rail links
- 4.5 The scheme has an interface with other GCP schemes including the Western Orbital Park and Ride interventions and the A10 Royston to Cambridge foot and cycleway. The connection to these schemes can be seen to further the additional GCP aims and objectives including:

- Invest in public transport (including Park & Ride) to make bus travel quicker and more reliable
- Build an extensive network of new cycle-ways, directly connecting people to homes, jobs, study and opportunity.
- Complementary to existing and proposed Park and Ride and Rural Travel Hubs.

4.6 It is intended to seek authority from the GCP Executive Board to review the existing work that has been undertaken and evaluate the options based on the GCP strategic objectives. It is programmed for such a review to be completed by June 2018. Work can then progress and an Options Appraisal Report (OAR) and an Outline Business Case (OBC) can be completed by end of 2018. Following a public consultation in the spring of 2019, approval for a Full Business Case (FBC) for the scheme will be sought.

#### ***Rail implications***

4.7 The A10 currently takes around 16,000 vehicles per day in the Foxton area, the level of traffic that a road of this type could be expected to cater for. However, the presence of a full barrier level crossing significantly limits the capacity of the route. Currently, the Shepreth Branch line typically takes four Great Northern passenger train an hour in each direction, one or two of which stop at Foxton Station. The spacing of the trains and volume of traffic mean that queues on the A10 do not always have the opportunity to clear between level crossing closures, particularly at peak periods.

4.8 From 2018, the number of passenger trains using the route will increase to six trains an hour in each direction, with at least two stops per hour at Foxton. This will increase the closure time at the level crossing. In addition Freight trains also impact the crossing down time using a siding at Foxton that provides access to Barrington Quarry.

4.9 The East West Rail proposals would provide a new railway from the Bedford area to Cambridge, as part of a longer route from East Anglia to Oxford and potentially onwards to the west of England on existing lines. The route for the central section of East West Rail has yet to be determined, but it is possible that it could travel along the route of the Shepreth Branch through the Foxton area. The design of such a route would dictate no level crossings, meaning that an alignment through Foxton would have to provide a bridge or underpass across the A10. If the bypass scheme was progressed in advance of this process it would inform any option selection as opposed to be constrained by it.

4.10 As part of the national programme to close level crossings Network Rail have committed to a risk reduction programme. The objective of the programme is to close and upgrade crossings across the network, which will improve safety for everyone and reduce the risk that level crossings present to the national rail network. Network Rail has identified the level crossings on the A10 at Foxton as a suitable site for evaluation.

4.11 The Foxton level crossing bypass scheme has currently progressed through the GRIP 1 and 2 (Governance for Railway Investment Projects) stages. GRIP1 established the scope of scheme and the investment needed and potentially asset renewal and GRIP2 defines the investment goals and identifies constraints to ensure that they can be achieved both economically and strategically. GRIP2 identifies the route Options and narrows the assessment to preferred

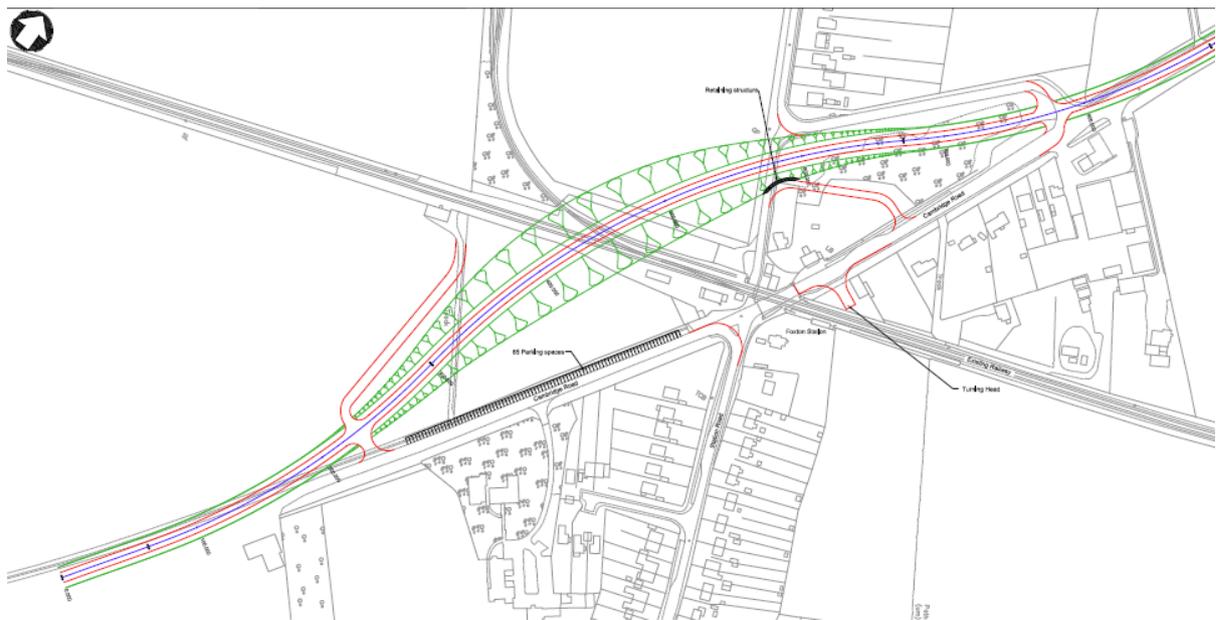

options based on the requirements of the statutory undertakers, physical and environmental constraints and makes recommendations for further work.

4.12 In the 2013 GRIP2 work confirmed that the most feasible options were for a bridge or underpass taking the A10 across the railway on an alignment to the north of the current road. It also noted that while a bridge would be cheaper, an underpass would be likely to be less intrusive. Figures 2 and 3 below show an indicative bridge and underpass route option considered on the north side of the A10 from the GRIP2 report.

Figure 2: Indicative overbridge option layout from GRIP2 report

Figure 3: Indicative underpass option layout from GRIP2 report

***Travel Hub - Park and Ride***

4.13 The 2013 GRIP2 report shows that an additional 85 car parking spaces could be provided as an option to be delivered within the scheme. However, in light of the current forecast growth and the possible investments in the rail service and potential for station improvements consideration should be given for Foxtton Station to act as a Travel Hub (Park and Ride / Rail facility) with sufficient car parking provision to accommodate demand for onward rail trips into Cambridge.

## 5.0. Options

5.1. The assessment work undertaken in 2013 did not conclude a Benefit to Cost Ratio (BCR) as the scheme was not fully costed. However, the assessment of similar schemes and the forecast growth of train and traffic travel patterns in Foxtton indicates that the likely BCR value would be 'high' or 'very high' (The Department for Transport uses the following categories in relation to Benefit Cost Ratios: Low Value for Money if BCR = 1.0 to 1.5; Medium Value for Money (VfM) if BCR = 1.5 to 2.0; High Value for Money if BCR = 2.0 to 4.0; very high VfM if the BCR is greater than 4.0). The LTP estimates costs for the scheme within the range of £14-24M and the GRIP2 report estimated costs between £11-19M, but these costs are now considerably out of date.

5.2. It is recommended that the costs for Foxtton would need to be assessed in more detail, further work on proposals should seek to develop and assess options that:

- Provide a bridge or underpass for the A10 across the Shepreth Branch to the north of the current A10 alignment, allowing for the closure of all three level crossings in the Foxtton Station area.
- Provide pedestrian and cycle facilities that allow grade separated crossing of both the railway and the A10:
  - for journeys between Foxtton and the A10 cycle route;
  - for journeys between Barrington and Foxtton / Foxtton Station; and
  - across the railway at a footbridge at Foxtton Station.
- Consider the junction strategy for the terminal points of the A10 bypass alignment, in the context of the above, and also of the additional points noted below.
- Provide enhanced facilities at Foxtton Station including car and cycle parking, passenger waiting facilities, ticket machines.

5.3 In addition it is recommended that the development of options should:

- Explore the opportunity for Foxtton Station to act as a Travel Hub with a Park and Ride facility for onward rail trips into Cambridge and Cambridge North stations, and the future Cambridge South station.
- In discussion with Network Rail, consider the implications of an East West Rail alignment through the Foxtton area and how it would impact on the level crossing and station improvement options (including whether East West Rail trains might stop at Foxtton).
- Be future-proofed against a possible future requirement for further platform lengthening to allow 12 carriage trains to stop at Foxtton.

## 6. Next steps and milestones

6.1 This report has identified a number of feasible proposals for interventions at the Foxtton level crossing. It is now proposed to recommend the review of these options and the development of an 'outline business case' for a preferred option.

6.2 The proposed timetable for the business case development work is as set out below in Table 1:

<b>Activity</b>	<b>Target completion date</b>
Review the existing GRIP 2 report and options recommended	June 2018
Develop series of distinct options for bypassing the level crossing (including consideration of developing additional parking arrangements)	October 2018
Present options for consultation to GCP Executive Board	December 2018
Public Consultation on Options	March / April 2019
Final Option recommendation to GCP Executive Board to be considered for approval subject to other investment priorities.	October 2019

6.3. Subject to the above the following key milestones will be undertaken:

Detailed design and other preparatory tasks for planning process	2020
Obtain relevant planning powers to construct	January 2021
Start construction	Summer 2022
Scheme completion	December 2023

**Table 1 – Key Milestones (subject to statutory permissions)**

## **7.0 Implications**

### **7.1. Financial and other resources**

The scheme development is funded by Greater Cambridge Partnership through City Deal funding.

### **7.2. Legal**

No significant legal implications have been identified at this stage although they may emerge as the project moves towards the statutory process stage.

### **7.3. Staffing**

Project management is undertaken by Greater Cambridge Partnership. Consultants have yet to be appointed for any Design work needed.

### **7.4. Risk management**

A full project risk register forms part of the Project Plan.

### **7.5. Equality and diversity**

There are no equality or diversity implications in this report.

**7.6. Climate change and environmental**

The proposed measures have the potential to reduce congestion and improve air quality in the longer term through encouraging a shift towards sustainable transport modes.

**7.7. Consultation and communication**

Officers anticipate engagement with the statutory and local stakeholders through the future design phases of the scheme.

# Executive Summary

Mott MacDonald Ltd has been appointed by Network Rail to undertake a GRIP-2 feasibility study to review options to close the existing railway level crossing at Foxton, Cambridgeshire, and provide a suitable replacement infrastructure to cross the railway safely. The existing level crossing accommodates traffic using the A10, pedestrians, cyclists and equestrians. This report discusses the impact of closing the existing rail crossing on the local community and the A10 road user and identifies options investigated to close the crossing.

The rail level crossing at Foxton is on the Up and Down main Cambridge line which intersects with the A10 Cambridge Road adjacent to the station and is located approximately 7.6 miles south of Cambridge City Centre and 2.2 miles west of junction 11 of the M11 motorway. Foxton's population is currently approximately 1300 with the village bisected by the A10 and the railway line.

## Option Study

The options considered mainly fall into three categories,

1. Route options (Route A, B and C).
2. Structural Options (Overbridge or Underbridge).
3. Pedestrian/cyclist and equestrians crossing (footbridge or subway adjacent to the existing level crossing designed in compliance to the Equality Act (EA) 2010).

## Route Options

The option study evaluated a number of routes and types of construction which would be feasible. The online option (Route A) was dismissed due to the likely disruption caused to the A10 users and local network, and the option of a route to the south of the A10 (Route B) was not developed due to the presence of existing dwellings and statutory undertakers services. The area to the north of the A10 consists of large areas of farm land which can be utilised for the scheme development. The four sub-routes considered on the north of existing crossing (Route C) have been identified for further development and considered in the feasibility assessment. Each route is considered with the option of an overbridge and underbridge at the proposed crossing location, with approach embankments or cuttings of 1 vertical to 3 horizontal, with this stable slope dictating the acquisition of land for the scheme development. The speed limit on the existing highway is 50mph which is maintained in all the options considered with all routes allowing A10 traffic to flow freely without any disruption and is designed to minimise the impact on the local community.

**Sub-Route C1:** Highway alignment is designed to maintain the current design speed of 50mph for both horizontal and vertical alignment in accordance with TD 9/93 Highway Link Design.

**Sub-Route C2:** This Route is designed to consider a relatively smaller curve radius as compared to route C1. The route is designed to maintain 40mph design speed for the vertical and 50mph for the horizontal alignment. The 40mph design speed is below the desirable limit but falls within the acceptable range of TD 9/93.

**Sub-Route C3:** This route was developed to avoid land take to the Network Rail Depot on the north/west of the existing level crossing. This is the largest curve radius compared to other routes which leads to a significantly large structural span (54m) increasing the area of land take. The route is designed to maintain 40mph design speed for vertical and horizontal alignment.

**Sub-Route C4:** Similar to route C3, this alignment is designed based on 40mph design speed for both vertical and horizontal with a minimum curve radius. This route would require demolition of the existing Network Rail depot.

### **Bridge Options**

Each by-pass route considers an option of an underpass and an overpass at the proposed crossing point. Numerous forms of construction were studied based on the cost, constructability in a railway environment and environmental impact. In this option study, attention is given to limit the amount of work and time on site by considering a solution which involves as much prefabrication as possible.

The existing level crossing at Foxton is a highway crossing with full pedestrian, cycle and equestrians rights of way. Once the existing level crossing is closed, pedestrian, cyclist and equestrian access must be provided over the existing level crossing to maintain the connectivity between neighbourhoods and link between the station platforms. To achieve this, the report discusses options of providing a footbridge or subway at or adjacent to the existing level crossing location. The options would comply with the Equality Act 2010 and provide full disabled access either by ramps or provision of lifts. This report also illustrates the provision of providing bridle route over the main bridge crossing and at the existing level crossing.

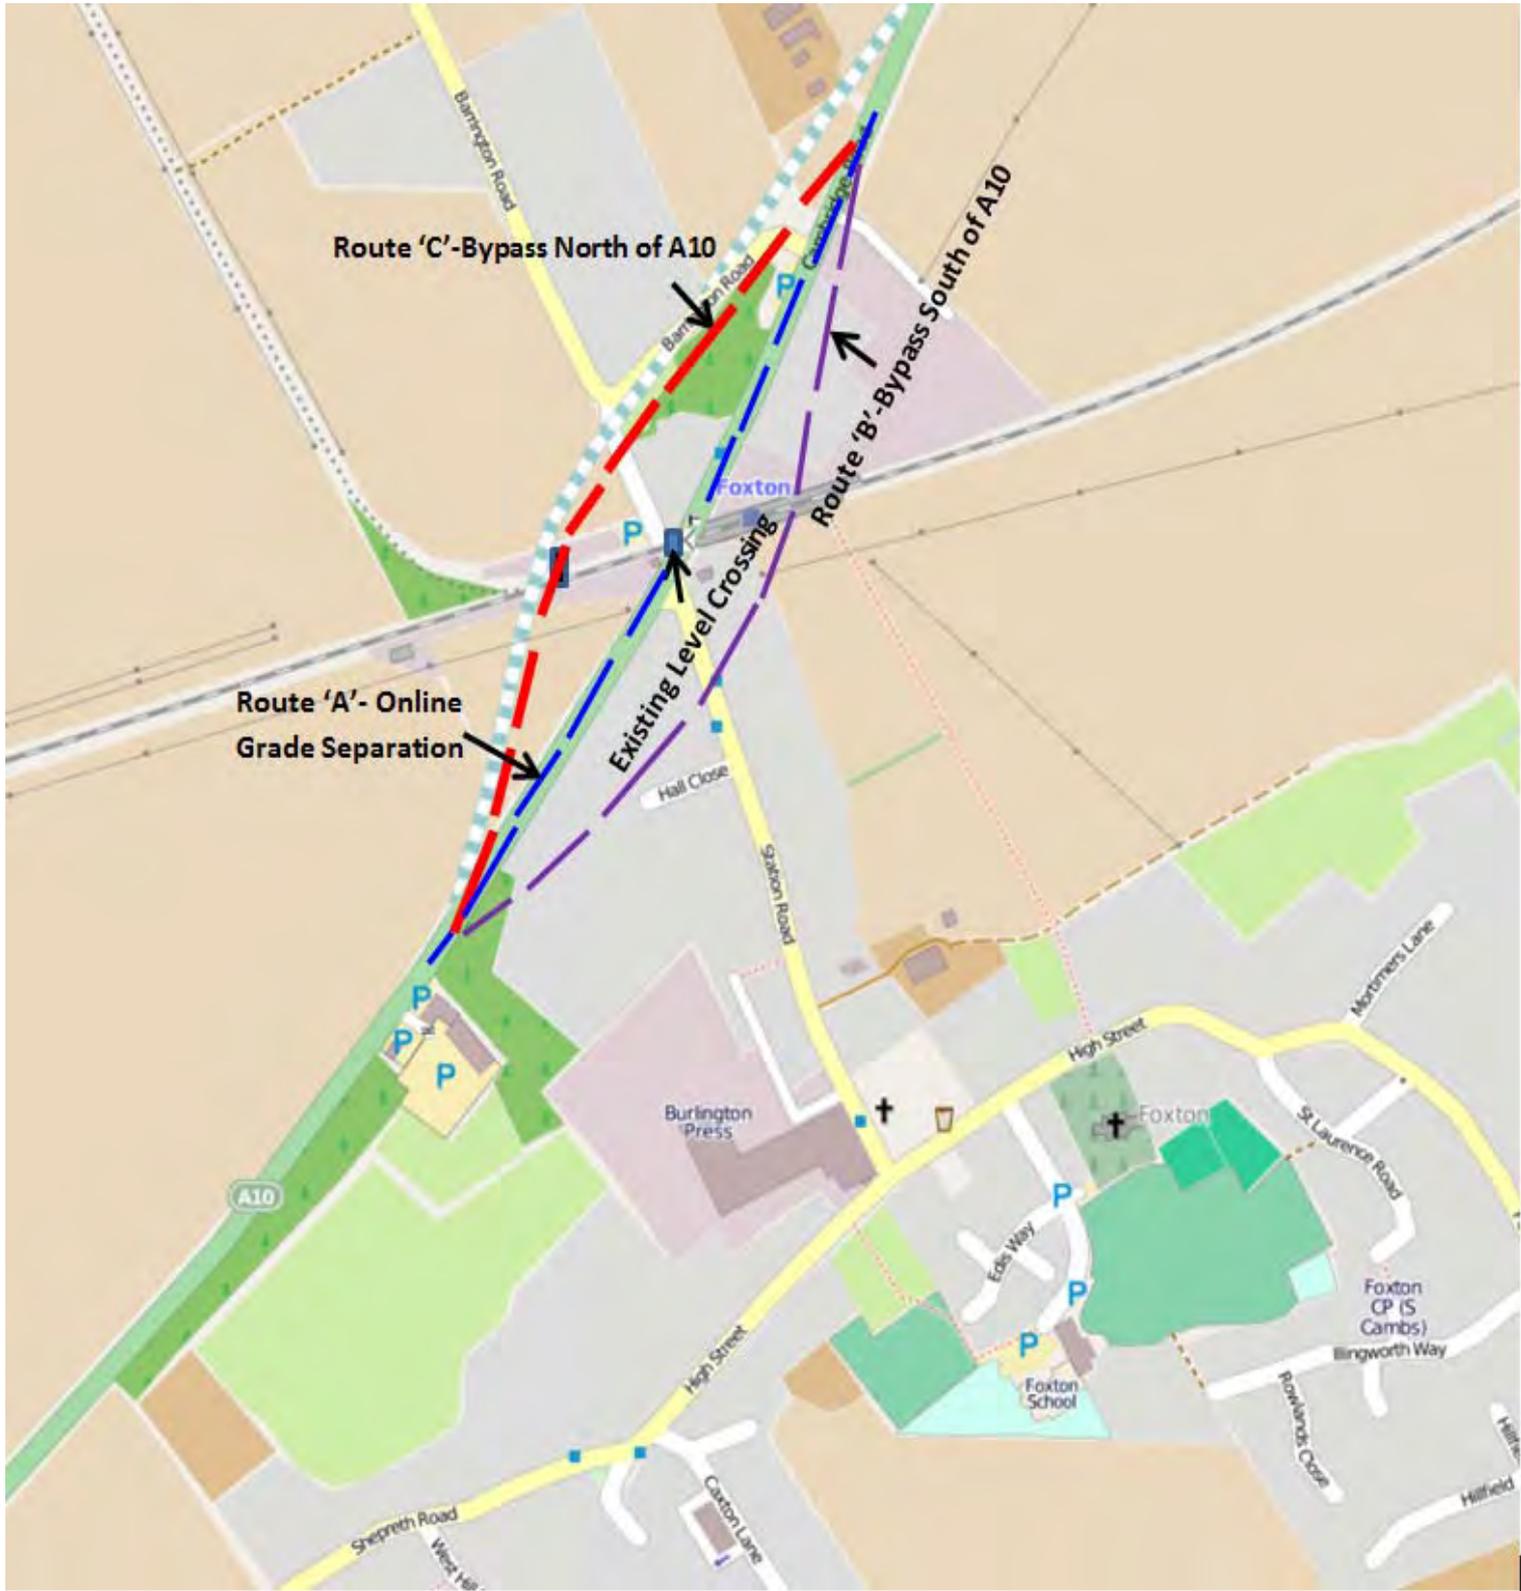

### **Preferred Options**

Taking into account the capital cost, the advantages and disadvantages of the respective options, and the opportunities for minimising risks; it is recommended that route option C4 with a road overbridge proposal is developed as the preferred solution. This is the shortest of all the routes which has an advantage of minimum land acquisition and improves site safety by limiting the construction period. This route offers a minimum structure span over the new level crossing thus minimising the disruption to rail movement and impact on the local community. The overbridge option limits the requirement for possessions when compared to an underpass option. The capital cost estimate of this option is **£11,650,000** which is the cheapest of all options and is one of the key factors in preferring this route.

In addition to the main road overbridge option, to facilitate pedestrians and cyclists at the existing level crossing, a footbridge will be provided with lift access. The provision of this additional pedestrian route will require a minimum land take and will limit the impact on local community during construction. The capital cost estimate of this option is **£2,300,000**. The preferred route for equestrians is the bypass route over the main road bridge crossing. This route will be more convenient for the riders compared to a combined footbridge for pedestrians and equestrians over the existing level crossing.

In order to progress the work we recommend the review of the following key issues in the next GRIP stage,

- Undertake detail ground investigation and prepare a factual report based on the investigation.
- Carry out a topographic survey of areas where the proposed works impact on existing infrastructure or external land owners.
- Investigate the existing buried services and negotiate with the land owners.
- Carry out an outline design of the structure, to facilitate early acceptance from key stakeholders.
- Consult with the local community.

Indicative Route Plan – Figure 1

# 1 Introduction

## 1.1 General

There are approximately 9,000 level crossings in Great Britain and of these, around 7,700 are on the national rail network. Within Cambridgeshire, Network Rail has 176 level crossings (on the Anglia Route), 72 carry public vehicular rights, 51 carry public footpath or bridleway rights, and 53 carry private vehicular rights.

Almost half of all rail related accidents occur at level crossings and the number of incidents of near misses and misuse of level crossings is increasing steadily. Network Rail (NR) is committed to reduce this risk by closing level crossings where reasonably practicable, to improve safety for the general public (refer to NR policy statement in Appendix 'U').

The level crossing at Foxton crosses the A10 Royston to Cambridge Road. The NR assessment score for this level crossing is within tolerable limits as no major accidents have been reported, but there have been a number of recorded instances of misuse and threatening behaviour by members of the public impatient to cross the line.

## 1.2 Foxton Level Crossing

The level crossing is currently carrying the A10 Royston to Cambridge Road (indicated as 2 in figure below) across the Up Cambridge and Down Cambridge line at a skew.

The level crossing at Foxton is a highway crossing with full pedestrian, cyclist and equestrian right of way. Currently, the crossing is controlled from the adjacent gate box located to the west of Foxton station. The crossing has an electronic barrier across the full width of the road which stops the A10 traffic passing. There is no footbridge at the crossing but there are two pedestrian/cycle and bridleway points at the intersection (indicated as 1 & 3 in figure below). These points are secured by steel gates on either side of the crossing and are locked remotely using electromagnets during train crossings to prevent pedestrian or equestrian movements. The risks associated with the level crossing are discussed in section 2.1 of this report.

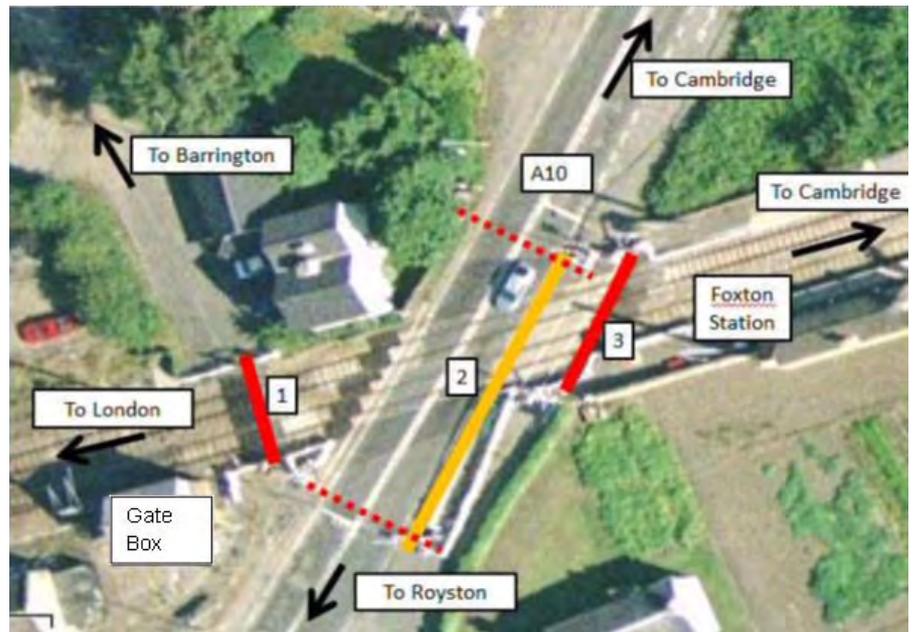

Figure 1.1: Plan of existing crossing

### 1.3 Report Objectives

The aim of this GRIP 2 Feasibility report is to assess engineering options for replacing the level crossing with a grade separated solution, which would comprise either an overbridge over the railway or an underbridge which allows the A10 vehicular traffic to go under the existing railway lines.

A separate pedestrian facility to link the existing platforms and to maintain the existing public rights of ways for pedestrians, cyclist and equestrians will be considered local to the existing level crossing. The facility must be in full compliance with the Equality Act 2010. The fundamental design goals of this scheme are to:

- Promote efficient operation of railway and highway and aims to reduce risk of accidents/collision;
- Promotes village amenity;
- Provide neighbourhood connectivity;

- Facilitates pedestrian/cyclist and bridleway safety and
- Provide a parking facility for the railway station.

The scheme will relieve A10 traffic congestion and delays from barrier closure due to frequent train movements. It will also allow the local highway and railway network to develop in the future, if required.

The report identifies the options to close the existing Foxton level crossing and adjacent Barrington Road foot crossing, including the removal /alteration of associated signalling equipment and the provision of suitable fencing/vehicle incursion restraint systems at the site of the crossing.

The proposal highlighted in this study must ensure that Network Rail's plan to improve the platform lengthening in the future is safeguarded.

This report considers the following:

- It discusses the options to provide relief from traffic congestion and improve the road safety of the A10 traffic, and convenience for the community using the level crossing;
- It summarise the forms of construction and discusses structural alternatives based on the existing constraints, buildability, associated risks, traffic management, track possession, cost estimation, maintenance and sustainability;
- It lists the technical studies and analysis that have been prepared as part of this study;
- It lists the estimated construction time and cost of considered options;
- It lists the advantages and disadvantages of the options studied and
- It recommends a preferred option, which will require further design development during the GRIP 3 stage.

This report describes the evolution of the project from the original scope of works, describing the key decisions taken and the reasoning behind them.

This report forms the preliminary stage of the Technical Approval process with the preferred option being taken forward to the next GRIP stage.

#### 1.4 Geographical Boundaries

The geographical scope of this work covers the Foxton Level crossing and interface infrastructure.

The Engineering Line Reference of the crossing is SBR. Shepreth Branch: Hitchin, Cambridge Jn-Shepreth Branch Jn. Mileage is 50 miles 74 chains Grid Reference TL408407.

## 2 Objectives and Considerations

### 2.1 Description of the challenges

The A10 is a main route which links the Greater London Boroughs with Cambridge and Royston. A traffic survey was carried out by WS Atkins in 2001 to establish the existing traffic levels on the A10. The manual traffic count (12 hours) survey revealed approximately 11,800 vehicles crossing the junction every day.

A minimum off peak traffic count was undertaken in November 2012 by Network Rail, which provides a more up to date data on volume of traffic using the level crossing. See Appendix 'M' for details.

The volume of through traffic using this crossing point is expected to grow in line with national trends and due to the future development of local housing. The existing railway level crossing stops the road traffic frequently due to the busy nature of the main railway route into London via Royston, therefore causing traffic delays and inconvenience to the road users. The existence of the level crossing also presents a possible weakness to the operation of the Train Operating Companies (TOC) services and safety to their staff.

#### 2.1.1 Risks Involved

The level crossing at Foxton does pose a safety risk to road and rail users. The particular risks involved at the existing level crossing(s) are highlighted below:

- If the gates for the pedestrian crossing are locked of use, then pedestrians, cyclists and equestrians have to use the route under the main barrier, sharing this with the high speed (50 mph) traffic on the A10;
- If the crossing is not used correctly (i.e. 'misuse'), there is a significant risk of an accident and injury;
- There is a risk of slips, trips and falls while crossing the railway line;
- Equipment may be damaged due to vandalism.

In order to eliminate these risks, this study discusses different options for the removal of this level crossing.

It must be noted that the crossing in its current form is safe if used correctly, and is fully compliant with Network Rail's Level Crossings Standards.

## 2.2 Key Challenges in the scheme development

The key issues relevant to this feasibility study are summarised below:

1. Local community;
2. Network Rail;
3. Statutory Undertakers';
4. Land ownership;
5. Geography and general site condition;
6. Ground data and groundwater condition.

### 2.2.1 Local community

The impacts on local residents are considered to take a key issue during the scheme development. The route options selection will be developed to minimise the potential social effects on the local community by providing easy access as part of the preferred option. Where possible conflict between the through traffic and local village traffic will be minimised. The options have been assessed to meet the importance of providing continuous emergency and police service access to the village of Foxton.

Construction traffic movements and noise during construction will have a detrimental impact on the community. Construction stages and techniques that minimise the disruption to rail traffic and noise impact on the local community are considered in this feasibility study.

All route options have to ensure considered by ensuring that the existing public right of way and bridleway is facilitated. This can be incorporated into Network Rail's passengers' requirement to link platform 1 and platform 2.

### 2.2.2 Network Rail

Network Rail is keen to ensure that the continuous operation of the network is maintained. Therefore, in any option selected, the effects on

the operational railway operation must be kept to a minimum, and any proposed structural options must be constructible during any rule of the route (ROR) possession, and or within reasonable blockade duration.

Network Rail requires a direct link between platforms 1 and 2 to be maintained to ensure passenger connectivity and operational flexibility of their network.

An existing Network Rail Depot is located to the northwest of the level crossing, adjacent to Barrington Road. It is understood that this Depot is of a non-critical operational nature, and the land can be considered as non-essential during the options study.

Due to the presence of the level crossing, the overhead line equipment (OLE) adjacent to the crossing is set at a higher level than desirable. Where possible, the OLE is to be lowered to meet Network Rail standards.

It is understood that the level crossing signal/gate box building is not listed. Therefore it can be demolished as part of the proposal, if considered necessary. However, the interlocking building to the west of the signal/gate box must be maintained to allow the continuous operation of the line.

### 2.2.3 Statutory Undertakers

Based on the data provided by the Network Rail, various statutory undertakers' apparatus have apparatus present in the area of the level crossing, along the A10, Station Road and Barrington Road.

A medium pressure gas main, BT and virgin media cables run underneath the existing level crossing location. Electricity and telecom cables supporting the railway operation run at the ground level. Drawing records also indicate the presence of a 3" diameter water main crossing the track from the existing bridleway crossing point. These services are would require diversion if an underpass online option is considered.

A pumping station is located to the northwest of the level crossing together with an associated foul sewer (6" rising main) crossing the A10 carriageway from north and south of the existing crossing point.

### 2.2.5 Geography and general site condition

The area of the study includes land within the village of Foxton. The proposed route options will commence approximately 220m along the A10 from the level crossing in both directions. The total length of any proposed by-pass will be approximately 500m.

The approximate National Grid Reference co-ordinates of the proposed level crossing are 540862 Easting and 248752 Northing. The terrain of the site area is generally flat comprising undeveloped farm land to the northwest and southeast, with domestic properties and small farm holdings to the northeast and southwest.

Based on the Environment Agency's website information, the site is located within Flood Zone 1, which is defined as land assessed as having a less than 1 in 1000 annual probability of river or sea flooding in any year. Therefore the site is located in an area of lowest flood risk.

In the absence of any topographic information, the topography of the site is considered to be flat, based on observation from the initial site visit.

### 2.2.6 Ground data and groundwater conditions

The British Geological Survey (BGS) records have been searched to ascertain the ground data records adjacent to the proposed site. Records of a number of exploratory boreholes in close vicinity of the site were available as follows:

- BGS Ref TL44NW11- a borehole located towards the eastern end of the route options, less than 50m from the site near the existing petrol filling station on the A10 (see figure 2.1 below).
- BGS Ref TL4NW7- a borehole located less than 200m from the site, at the junction of Station Road and Hall Close (see figure 2.1 below).

Figure 1.4: Borehole Locations

The borehole records indicate the following strata in the vicinity of site:

The bore hole record TL44NW11 indicates:

FROM	To	MATERIAL
EGL	0.3m	Topsoil
0.3m	2.8m	River gravels (Gravels and sand)
2.8m	21.4m	Chalk Marl and Cambridge Greensand

The bore hole record TL4NW7 indicates:

FROM	To	MATERIAL
EGL	0.3m	Topsoil
0.3m	3.0m	River gravels (Gravels and sand)
3m	18.3m	Chalk Marl and Cambridge Greensand

Ground water levels were encountered at 2.4m bgl in borehole TL44NW11 and 1.8m bgl in borehole TL4NW7. Based on this information, the water table will have a significant impact on the structural form, so a detailed ground investigation and preparation of factual and interpretation reports are recommended in the next GRIP stage to justify the options discussed.

# 3 Options

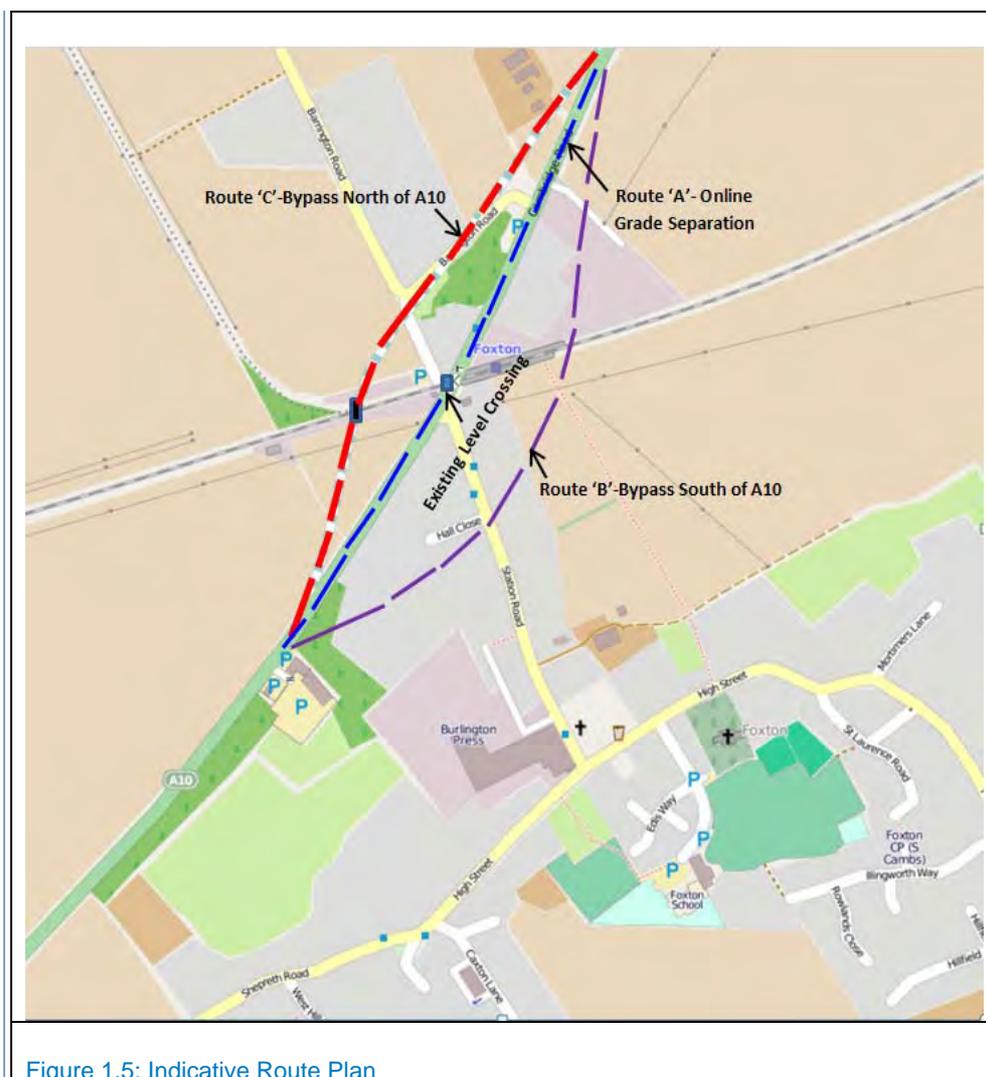

## 3.1 Route Options

This section provides an outline evaluation of the route options considered to eliminate the Foxton level crossing. The route options are developed based on the Ordnance Survey (OS) mapping available. The following sections discuss each Route option considered and the reasoning behind its continued development or discounting from the process. Following the completion of evaluation, recommendations will be made as to which options are not viable and which proposal should be taken forward into the next GRIP stage. A summary of the strengths, weaknesses, opportunities and threats (SWOT) of each option is provided which can be found in Appendix 'A' of this report.

This study considers the Do-nothing option as well as the following road route options:

- Route A – On-line Option Grade Separation
- Route B – By-pass South of the A10
- Route C – By-pass North of the A10

While considering the options, reference was made to the previous study undertaken by WS Atkins on behalf of Cambridgeshire County Council (CCC) in 2002.

### 3.1.1 Do-Nothing Option

The Do-nothing scenario considers no change from the existing situation at the level crossing. Whilst the level crossing is currently in compliant with Network Rail’s requirement, the safety/security risks and highway congestion remain unresolved, which was the primary driver of this study. Furthermore, the Do-Nothing Option does not meet the aspiration of Network Rail’s current policy statement with regards to level crossings, (see Appendix ‘U’ for NR’s Approach to level crossing

safety), therefore the Do-nothing Option will not be taken forward at this stage for further consideration, but may be revisited once all other options have been exhausted.

Photo 1.3: Existing Level Crossing

### 3.1.2 Route A: On-line Grade Separation

On-line grade separation option utilises the existing A10 corridor. This proposal maintains the railway line on its current alignment and level:

- Option A1 - is the construction of a new underpass to take the A10 below the railway line.
- Option A2 - is the construction of a new flyover to take the A10 above the railway line.

The underpass option A1 will require the construction of a railway underbridge to carry the existing railway lines and OLE. This will require a substantial length of approach retaining walls on either approaches to

the railway, approximately 220m long and up to 6.5m in height, to support the existing ground and adjacent properties.

The flyover option A2 will consist of a bridge constructed over the existing railway line to carry the A10 with a series of approach structures on either side of the railway line supported on piers. An alternative option is to support the approaches to the flyover on solid earth embankments with retaining walls, or with a standard 1 in 3 sloped embankment. This option will require a significant land take outside the current A10 footprint and has been discounted for this reason.

Issues cited as reasons to favour or not favour this option are listed in section 10 of this report.

Due to the significant traffic disruption envisaged on the A10, the disruption to Foxton Railway Station, the permanent closure of Station Road, the significant adverse effects to the residences immediate to the A10, together with the other Route option available, the On-line grade separation option is considered in practicable, hence will not be considered further in this report.

### 3.1.3 Route B: By-Pass South Side

The Route B option is to construct a by-pass for the A10 to the south of the existing route as indicated in fig 1.5.

This route option will have a significant impact on the local environment and population. This route option will have direct impact on the residential dwellings immediately to the south of the A10 which will make selection of this route difficult. Up to 10 houses will be affected by this route, located on both the east and west side of the level crossing and would have to be demolished. Noise and dust emission levels during construction would be high directly affecting the residents of the community in the short term. This route option is likely to receive strong opposition from local residents, resulting in a public inquiry.

Station Road is a main route to Foxton Village Centre; this route option will require a closure of Station Road with a provision of either an alternate route or an overbridge over the road which would significantly increase the cost of the scheme. This route will interface with existing utility services (water mains and sewer). The diversion of these services is unavoidable and will have significant cost implications. Moreover, the presence of the station platform on the south side is unavoidable and would require a long span crossing over the existing platform. The route to avoid station platform is not advisable as it would restrict future extension of platforms in that direction.

### 3.1.4 Route C: By-Pass North Side

Unlike the area to the south of the A10, the area to the north comprises of open farm land which allows several sub-routes to be developed without having, as a severe direct impact on residential properties, as Route B.

Cambridgeshire County Council's (CCC) current requirement for the by-pass is to accommodate a 7.3m wide two lane carriageway with a 1m grass verge to accommodate equestrian use and a further 3m for a combined pedestrian footway and cycleway on one or both sides of the carriageway. During the next stage of this scheme development, the detail of this will be agreed.

The sub-route options consider alternatives for a fly-over and an underpass. The sub-route alignments are designed based on the appropriate vertical and horizontal alignment curve to comply with the relevant design speed, in accordance with TD 9/93 Highway Link Design. The highway alignment will be designed to:

- To keep the connectivity of local streets to the A10 Cambridge Road, particularly to a number of dwellings in Barrington Road.
- To provide turning facilities for the vehicles due to the closure of the main road at the existing level crossing.
- To create a new car parking facility in between the bypass route junction on the south side and existing level crossing. The proposal will create upto 85 car parking spaces which will encourage further train usage.

The alignments are developed using the geometric requirements contained within TD9/93. Cambridge County Council as the local Highway Authority has stipulated a 50mph design speed limit for the by-pass; therefore in accordance with TD 9/93, the vertical and horizontal design curves appropriate to 50mph will be preferred. However, TD 9/93 also accepts design curves for 40mph.

The following sub-routes are considered for Route C.

1. Sub-Route C1: 50mph road design speed for vertical and horizontal alignment ;
2. Sub-Route C2: 40mph road design speed for vertical and 50mph design speed for the horizontal alignment ;
3. Sub-Route C3: 40mph road design speed for vertical and horizontal alignment avoiding the existing Network Rail depot.
4. Sub-Route C4: 40mph road design speed for vertical and horizontal alignment (min land take).

#### 3.1.4.1 Route C1 – Highway Alignment with 50V & 50H Curves

This option proposes to provide a by-pass route north of the A10, and crosses the railway line with an option of an overbridge or underbridge to the west of the Foxton station. In this option, the highway alignment is designed to meet the desirable minimum vertical and horizontal

curves, appropriate for a design speed of 50mph. The slope of approach embankments or cutting considered for the highway alignment is generally 1 in 3. This slope is chosen to check the design feasibility of routes, although embankment slopes can be varied to limit the level of land take if necessary. The route leads to larger curve radius resulting in a 32m span bridge span. The route will require a small retaining structure at Barrington Road (as shown on the scheme plan). The main drawback of this route is that it clashes with the rear garden of a residential property located on the Barrington road. This route clashes with Network Rail depot car park.

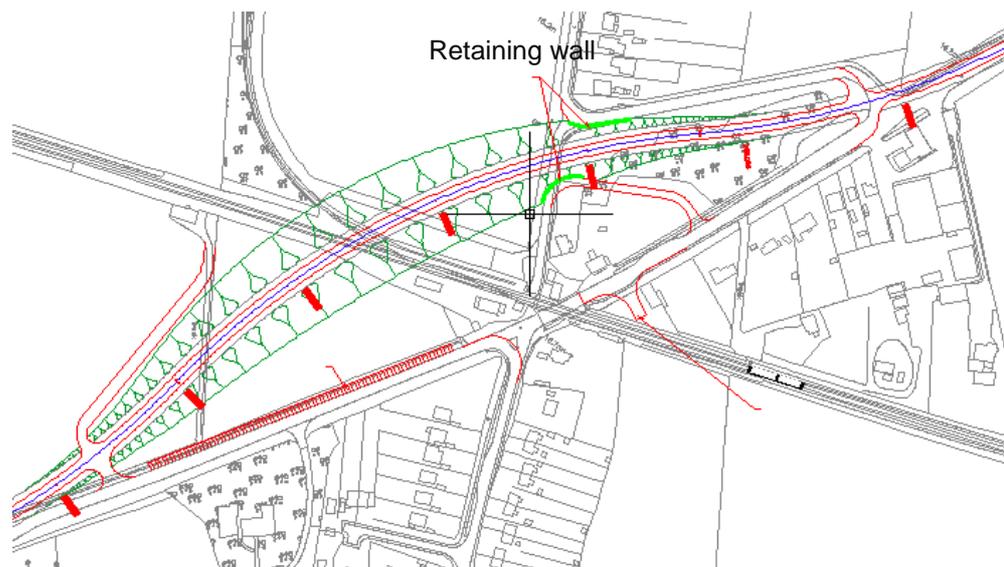

Figure 1.6: Route C1 Layout

### Route C1 Structure Configurations

An overbridge/flyover at this location will comprise a single span bridge, approximately 32.6m clear skew span, with a 40 degrees skew between the abutments and the deck. The width of the structure will be approximately 22.6m.

An underbridge/underpass at this location will comprise a single span bridge, approximately 20.1m clear skew span, with a 42 degrees skew between the abutments and the deck. The width of the structure will be approximately 26.6m.

### 3.1.4.2 Route C2 – Highway Alignment with 40V & 50H Curves

This option is similar to the Route C1; the highway alignment is designed to maintain a vertical alignment suitable for a design speed of 50mph and a horizontal alignment suitable for a design speed of 40mph. Although the horizontal design speed is less than the desirable limit it still lies within the acceptable standard of TD 9/93. This route option has slightly smaller curve radius compared to route C1, resulting in reduction to the total length of the by-pass. Similar to Route C1, this route clashes with Network Rail depot car park.

Figure 1.7: Route C2 Layout

#### Structure Configurations

The proposed overbridge/flyover at this location will comprise of a single span bridge, approximately 31.5m clear skew span, with a 42 degrees skew between the abutments and the deck. The width of the structure is approximately 22.5m.

The proposed underbridge/underpass at this location will comprise a single span bridge, approximately 19.8m clear skew span, with a 43 degrees skew between the abutments and the deck. The width of the structure is approximately 26.6m.

### 3.1.4.3 Route C3 – Highway Alignment with 40V & 40H Curves (Avoiding the existing depot)

For this route, the highway alignment design is based on the design speed of 40mph for both horizontal and vertical alignment, which is less than desirable but within the acceptable standard of TD 9/93. The option is proposed to limit the effects to the existing Network Rail Depot located northwest of the existing level crossing. As illustrated below, this option has largely avoided the Depot and also eliminates the need for retaining walls at Barrington Road, but has increased land take substantially, as well as increase in the size of the over or under bridge.

Figure 1.8: Route C3 Layout

#### Structure Configurations

The proposed overbridge/flyover at this location will comprise a two or three span bridge, of overall length of approximately 50m clear skew span, with a 40 degrees skew between the abutments and the deck. The width of the structure is approximately 22.8m. The increase in bridge span (compared to Routes C1 and C2) is necessary to support the railway track on the branch line.

The proposed underbridge/underpass at this location will comprise of a single span structure, approximately 22.9m clear skew span, with a 43 degrees skew, between the abutments and the deck. The width of the structure is approximately 50m. Alternatively, the structure can be split

into two small width structures, one to carry the Cambridge Up and Dn line, and the other to carry the branch line.

The merit of these underpass options should be considered further if this sub-route option was selected for further consideration.

#### 3.1.4.4 Route C4 – Highway Alignment with 40V & 40H Curves (Min land take)

The highway alignment of this sub-route option is based on the design speed of 40mph for both horizontal and vertical alignment. The proposed alignment is shown in Figure 1.9 below.

This route is the shortest of proposed options and minimises the area of land take and the structural span of the bridge. This route will require demolition of the existing Network Rail Depot. Unlike other routes, this route protects the access track to the derelict building located to the west of bypass.

Figure 1.9: Route C4 Layout

#### Route C4 Structure Configurations

The proposed overbridge/flyover at this location will comprise a single span bridge, approximately 19.7m clear skew span, with a 36 degrees skew between the abutments and the deck. The width of the structure is approximately 26.7m.

The proposed underbridge/underpass at this location will comprise a single span bridge, approximately 20.8m clear skew span with a 36 degrees skew, between the abutments and the deck. The width of the structure is approximately 21.7m.

### 3.2 Bridge Options

The level crossing is on the main Up and Down Cambridge line which is the main route to London and has been assessed as a high demand route with restricted access. Therefore, in any structure option selection, the option effects on the railway operation must kept to a minimum, and any proposed structural options must be constructible during a 'Rules of the Route' (ROR) possession or within a reasonable blockage duration.

#### 3.2.1 Overbridge Options

For all overbridge options, the substructure will be set 4.5m back from the running edge of the cess rail on either side. This is to ensure that the substructures can be constructed with minimum or no possession. This setback will also eliminate the need to design the substructure for derailment impact, which means the substructure can be more cost-effective.

To minimise the possession requirement for constructing the superstructure, a quick and self-supporting solution should be considered, e.g. beam and slab deck. The beams can be erected during a night-time possession, with permanent shutters spanning between the beams. This would allow the construction of the deck to follow continuously without possession.

The overbridge option should be able to accommodate future widening of the A10 to a dual carriageway with minimal to no demolition.

##### 3.2.1.1 Precast Prestressed Concrete (PPC) Beams on Cantilever abutments (Option 1)

This form of superstructure construction is quick and requires minimum possession time. The bridge will consist of PPC beams simply supported on full height reinforced concrete abutments. An insitu

reinforced concrete deck is designed to act compositely. Permanent formwork will be used to support the wet deck concrete during construction.

PPC beams are heavy and require a bigger crane for lifting when compared to other forms of construction. As the access and space at site is unlikely to be restricted, the lifting requirement for a heavy crane is not considered to be an issue.

A preliminary assessment of the foundation type required for the proposed structure has been undertaken based on the available ground information in the proximity of the level crossing. The assessment concludes that spread foundations are not appropriate for the bridge abutments and a piled solution is required with the piles socketed into Chalk Marl. A detailed investigation of the pile design has not been undertaken at this GRIP stage, but an initial assessment suggests that a CFA piling system will be appropriate due to its vibration free and quick installation. A high groundwater table will require casing for the installation of the CFA piles. Note that full height abutments will generate additional horizontal pressures on the piles but these can be designed accordingly. The piling activity and full height abutments will increase the proportion of wet concreting on site, which will have an impact on health and safety, and will be a risk for the site force working in the close proximity of the live rail traffic.

It is important to mention here that the final choice of foundation should be confirmed following a more detailed site investigation, which is outside the scope of this study.

#### 3.2.1.2 Integral/Semi Integral Bridge on bankseat abutments (Option 2 & 3)

This form of structure will comprise of PPC beams cast integral or semi-integral with insitu reinforced concrete bank-seats and spread footings. Bank seat abutments will comprise of one of the forms of construction discussed below.

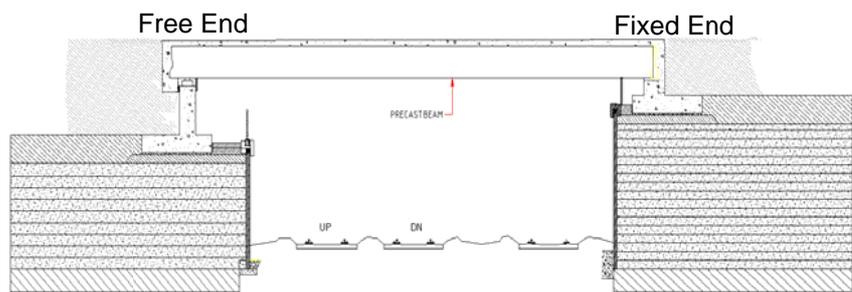

Figure 1.10: Semi-Integral Bridge

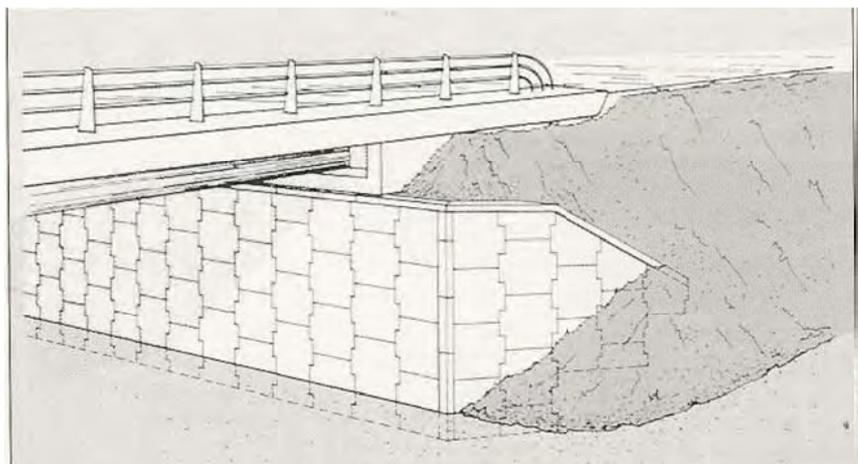

Figure 1.11: Semi-Integral Bridge

### **Fully Integral Bridge (Option 2)**

The use of an integral form negates the need for bearings and movement joints. This will minimise the maintenance requirements and reduce the whole life cost of each structure. In this option, bankseat abutments would be seated on compacted granular fill material normally at 1:2.5. The bankseat would require to be set back at some distance from the track to accommodate slopes of the material and would significantly increase the span of the bridge and the construction cost associated to this when compared to full height abutments.

The span of the structure can be reduced by supporting the bankseats on vertical reinforced earth walls founded on an unreinforced concrete

levelling pad (as discussed in option 3 below). This option is not viable in this situation due to a significantly larger span of the structure (40m), as the reinforced earth walls are not normally designed to take significant thermal movements occurring from a fully integral connection. The maximum span limit for a fully integral bridge resting on reinforced earth wall is 18m in accordance with BD70/03.

Based on the available ground data, it is difficult to justify the feasibility of this option at this stage. The available ground strata may be too soft to support the fill material and a piled foundation underneath the bankseat footing may be necessary, which would make this option more expensive. A detailed ground investigation is recommended in the next GRIP stage to confirm the viability of this option.

### **Semi-Integral Bridge (Option 3)**

The proposal is similar to the fully integral option. Instead of resting bankseats on granular fill material, the bankseat abutments will be supported on vertical reinforced earth walls founded on an unreinforced concrete levelling pad. Independent reinforced earth wingwalls to retain approach embankments will also form part of the structure.

Reinforced earth walls consist of interlocking precast concrete facing panels tied back to the granular backfill with reinforcing straps. The structure is a standard form of construction and would overcome the issue of an increased span with bankseat abutments as discussed in the integral option above. In this option, one abutment will be cast integral with the superstructure providing full movement continuity. The other abutment will have bearings to accommodate the thermal movements of the deck. An end screen will be provided at the bearing abutment to protect the bearings from the backfill material. The end screen will be separated from the back face of cantilever abutment by means of a compressible joint filler. The joint will cater for the movement of the superstructure arising from thermal, shrinkage and creep effects, and the possibility of deck leakage through expansion joints will be significantly reduced. The maintenance cost of the structure will be higher than fully integral bridge will be lower than a full abutment height option. However there will be significant cost savings in terms of the overall construction cost of the structure.

The construction will be undertaken in phases. In the first phase, reinforced earth abutments will be constructed along with embankment construction using precast concrete facing panels and reinforcing strips. Backfilling activity behind abutments will be carried out in stages as the facing panels progressed towards top. This phase will give programme advantage in terms of construction.

The integral end of the structure will eliminate the need for the inspection of bearings, thus minimising maintenance and inspection costs. The option is economical as the reinforced earth walls use reinforced concrete facing panels as opposed to a full height abutment. Pre-stressed beams are low maintenance and there is also a minimal requirement for insitu concrete, which reduces the health and safety risk on site. The structure can be decommissioned easily and recycled at the end of its serviceable life.

The reinforced earth option minimises the amount of excavation. The inherent flexibility of the reinforced earth solution makes it possible to construct bridge abutments on relatively soft soil. The settlement of compacted reinforced earth material is normally the main risk in this design, which can be controlled with traditional soil improvement techniques.

#### 3.2.1.3 Steel Composite deck (Option 4)

A steel composite deck on cantilever abutment or semi-integral structure on bankseat is another option considered for overbridges. This form of construction will require rail possessions for the installation of the steel beams. The steel beams can be installed in pairs with cross bracing, with the permanent framework already attached, providing the necessary stability during erection and reducing the possession duration. The steel beams are generally spaced between 2.5 to 3.5m apart resulting in fewer girders compared to a PPC beams solution.

Steel beams are lighter compared to PPC and allow for quick installation utilising a smaller crane with minimal possession duration. A steel composite bridge will also benefit the construction by minimising the construction depth and the height of the approach embankments when compared to the PPC option.

However, the long term maintenance cost of steel structure is generally recognised as higher than a PPC beam solution, particularly with regards to the protected paint system. Alternatively, the use of weathering steel should be considered to eliminate the requirement of maintenance painting. A steel bridge will require earth bonding as it will be adjacent to the OLE.

### 3.2.1.4 Summary of Overbridge Options

A summary of the advantages and disadvantages of overbridge options is shown below.

Ref	Bridge Type	Advantages	Disadvantages
1	PPC Beams-Cantilever abutments	<ol style="list-style-type: none"> <li>1. Low maintenance cost compared to steel construction but higher than integral form of construction.</li> <li>2. Horizontal thrust will be sustained by the substructure when compared to integral options.</li> </ol>	<ol style="list-style-type: none"> <li>1. Large amount of crane lifts during erection.</li> <li>2. High volume of insitu concrete.</li> <li>3. Maintenance cost due to bearings and movement joints.</li> <li>4. Prestressed beams are heavier than steel beams.</li> <li>5. Construction depth will be greater than integral or semi-integral option.</li> <li>6. Will require longer construction time when compared to the integral form of construction.</li> <li>7. Substructure cost will be higher than integral or semi-integral options.</li> </ol>

2.	PPCs Beams- Semi-integral bridge	<ol style="list-style-type: none"> <li>1. Can be constructed on soft ground.</li> <li>2. Low construction depth.</li> <li>3. Low maintenance cost.</li> <li>4. Easy to demolish</li> <li>5. Simple, rapid and safe construction.</li> <li>6. Reduced need for piles or foundation improvement.</li> <li>7. Less volume of in-situ concrete when compared to alternatives.</li> <li>8. Panels can be modified on site to suit geometric constraints.</li> </ol>	<ol style="list-style-type: none"> <li>1. As (1) above</li> <li>2. Drainage outlets are required to prevent settlement.</li> <li>3. No cracks or warning of settlement is apparent on the structure.</li> <li>4. Requires additional cost of ground improvement to limit settlement issues.</li> </ol>
3	Steel Composite Deck.	<ol style="list-style-type: none"> <li>1. Easy to pre-camber during fabrication.</li> <li>2. Due to its lighter weight, smaller crane may be used during erection.</li> <li>3. Easy transportation and rapid erection.</li> <li>4. Shallow construction depth compared to PPC beams.</li> <li>5. Less number of beams will reduce the possession requirement.</li> </ol>	<ol style="list-style-type: none"> <li>1. Bracing between beams is required for their stability during erection.</li> <li>2. Higher long term maintenance cost.</li> <li>3. Bonding require for steel deck, due to close proximity to OLE.</li> </ol>

Table 1.1: Bridge Option's Comparison Summary

### 3.2.2 Underbridge/Underpass Options

The underbridge/underpass option will follow the road geometry similar to the overbridge option and will accommodate a 7.3m wide carriageway and 4.5m wide verges to protect pedestrian/cycleway and equestrian right of ways. The underbridge option will require a significant amount of excavation, which could be an issue due to the high ground water table. The risk of slope instability can be mitigated by considering cutting a slope of 1:3 in the alignment design, but this requires greater land acquisition. The amount of land take could be minimised by providing steeper slopes stabilised by ground anchors or retaining structures. In the absence of sufficient geotechnical information, this report does not consider the feasibility of soil strengthening or retaining wall techniques. Based on the initial assessment, it seems that acquisition of additional land will not be a major problem, but a detailed cost-effective analysis will required in the next GRIP stage.

A lower structure headroom can be achieved with this type of construction. The minimum headroom clearance of 5.3m (from carriageway level to the soffit) will be achieved in accordance with TD 27/01. This minimum headroom will require a structure to be designed for collision loading. Based on the site constraints, the following underpass construction proposals are considered feasible for the scheme.

To meet Network Rail's construction requirements, a reinforced concrete box option is the only feasible underbridge option.

The concrete box can be installed using the following methods:

1. Gradual jacking, under live railway operation;
2. Jacking during a blockade (cut and cover).

In both methods, a reinforced concrete box will be constructed in the approach cutting excavation adjacent to the rail track. No bearings or movement joints would be required for this option, thus significantly reducing the maintenance costs. Both types of construction will require large wingwalls on all four corners of the box, which could consist of steel sheet piles or concrete bored piles construction, and be

constructed prior to the installation to retain any excavation or cutting. The configuration of wingwalls has a huge impact in determining the box length, which ultimately affects the construction cost of the structure. The configuration of the wingwalls parallel or perpendicular to the box will lead to significant larger lengths and is not considered to be an optimum solution. It is appropriate to angle wingwalls and provide battered slopes at the ends, which will minimise the construction cost of wingwalls and visual tunnelling effect of the underbridge. However, the high water table level may affect the decision on the alignment of the wingwalls. This must be investigated further in the next GRIP stage.

The methods considered for the box construction are discussed in the following sections:

#### 3.2.2.1 Gradual Jacking method (Option 5).

This technique provides the benefit of construction with minimal disruption to the rail movement. This method will generally require a deeper road alignment to accommodate more fill over the structure, and constant track monitoring. Train speed over the structure will need to be restricted during the box installation for safety.

In this method, the concrete box will be constructed in an excavation adjacent to the rail track, with a leading cutting shield attached to the front of the box. As the box is jacked into the embankment, the existing ground is excavated carefully from within the box from the cut face. The process will continue until the structure is pushed to its final position.

This non-disruptive nature of the process, together with its safety mitigation measures and simplicity, has been considered as a best possible solution for tunnelling under the busy track. This type of construction requires a high level of precision and accuracy, along with constant track monitoring of track levels during the process, as this could affect the twist and cant of the permanent way.

#### 3.2.2.2 Jacking During a Blockade (Cut and Cover) (Option 6)

In this method, the reinforced concrete box will be constructed adjacent to the railway in the approach cutting excavated for the road alignment

as discussed above. Once the box is constructed the rail track would be closed to remove totally the fill under the track for the positioning of the box. This type of construction will require a possession of approximately 65 hours.

This technique was adopted for the replacement of Owen Street level crossing in Tipton. A photograph of the underpass showing excavation of the existing railway embankment in readiness for the jacking of the box structure are shown below, together with the completed structure.

Photo 1.4: Owen Street during main possession for installation.

Photo 1.5 – Owen Street Underpass after completion.

When planned and resourced properly, this type of installation can be successful. Unlike the gradual jacking method, this method eliminates the need for track monitoring, the risk of potential unforeseen objects within the excavation, and potential emergency stoppage due to any unacceptable settlement.

This installation technique will require minimum fill material over the structure. Therefore, the approach road alignment design will be shallower, potentially reducing cost for the excavation and retaining wall heights associated to the structure.

#### **Construction Issues for the Underpass Options:**

This option will require the use a considerable amount of concrete and reinforcement, not just for the box structure, but also for the jacking slab built beneath the box. The volume of excavation will be an issue for this form of construction due to the existing ground conditions.

The high water table on site may lead to a high risk of flooding during the construction requiring de-watering works. The high water table will also have an great impact on the long term maintenance of the structure and may require constant pumping of water to ensure the structure is not subject to flooding. From a design perspective, the structure will have to be designed to withstand high hydrostatic pressures which will make this option an expensive alternative. The presence of existing 8" diameter Anglian water foul sewer (rising main) is also an obstruction in the development of the underpass, which makes this option expensive and difficult to achieve.

A portal frame structure was considered as an alternative option, but discounted at early stage due to the complex construction requirements, extensive concreting and possession periods involved in building the structure.

### 3.2.3 Passenger/Public Footbridge-Options

The closure of the existing level crossing at Foxtan will require an alternative safe crossing route for the pedestrians, cyclists and equestrians. This section investigates the different options to facilitate the community and provide a link between station platforms after the level crossing has been closed. The following requirements have been identified as critical for the optioneering of the proposals:

- Minimal adverse impact on the local environment, adjacent land and properties;
- Minimal capital cost implications;
- Long term maintenance liabilities;
- Compliance with Network Rail design standard and Equality Act 2010 requirements;
- Constructability;
- Safeguard plan for future extension of the existing platforms;
- Continuous operation of the railway.

The following footbridge options are considered to be reasonable options and are discussed further in the report:

1. Footbridge with approach ramps and stairs;
2. Footbridge with stairway and lift shaft. ;

3. Footbridge with approach ramps to accommodate equestrians;
4. Subway with approach ramps.

#### 3.2.3.1 Footbridge with approach ramps and stairs (MMD-318484-C-DR-BR-103) (Option 7)

In this option, the bridge will be facilitated with stairs and Equality Act 2010 compliant ramps. The ramps will form a U-shape formation in line with station platforms. The footbridge and ramps will be owned and maintenance by Network Rail and the main aim of the footbridge is to provide the link between station platforms. It is preferred to position the bridge over the platforms or as close to the station as possible. The footbridge also serves as a local public right of way over the railway. The provision of using the footbridge for equestrians is considered as a separate option (refer to section 3.2.4.3).

Based on the available information, there were no undue constraints identified that will preclude the construction of a bridge or ramps.

There is an opportunity to minimise the land acquisition by opening the corridor between station platforms and the land owned by Network Rail which is currently being obstructed by a residential property (No. 2 Barrington Road). If this property was acquired, it will not only benefit the construction of proposed footbridge but will also facilitate the future extension of platforms.

The bridge span configuration is derived by positioning the bridge square to the track. An initial assessment suggests that this will provide a span saving of approximately 15% compared to its position in line with the carriageway. The footbridge supports will be set to a minimum of 4.5m away from the nearest rail or constructed at the back of the platforms. The proposed footbridge will be 2m wide, with a span of approximately 16m.

The ramps are located on private land, parallel to and behind the back of the existing station platforms. The approach ramps are designed to comply with Equality Act 2010 requirements for full disabled access with a maximum slope of 1:20, with 2m landings at 6m intervals.

The minimum required width of a bridge is 2m for unsegregated cycle and pedestrian access with a minimum headroom requirement of 5.1m from rail level as specified in NR/L2/TRK/2049. This headroom clearance will dictate a total ramp length of approximately 128m in accordance to Equality Act 2010 requirements. This will require more land acquisition and cause significant problems for people with walking difficulties and wheelchair users. This is not recommended by the 'Code of Practice for Disable People'.

#### 3.2.3.2 Footbridge with stairs and lift shafts (MMD-318484-C-DR-BR- 102 & 104) (Option 8)

In this option, lift shafts will be provided instead of ramps to facilitate disabled access which satisfies the requirement for wheelchair users and other people with disabilities. Stairways can be provided in a form of normal stairs or a wrap round solution which will provide a smaller structural footprint when compared to a normal. This option will comprise of two sets of stairs and lift shafts, located on each side of the footbridge. The configuration of bridge span will remain same as discussed above. Lift lobby areas will have a minimum headroom of 2.3m to canopies and suspended fittings and should accommodate minimum 16 passengers at a time. The main advantage of this option over the ramp is that it minimises the requirement for land acquisition, hence reducing the cost of the option. However, the continuous operational and maintenance cost of this option will also need to be considered in the whole life cost.

As with the previous footbridge option, this option cannot accommodate equestrian use on safety grounds. Therefore, equestrians will be directed to use the path provided by the by-pass.

#### 3.2.3.3 Footbridge with approach ramps to accommodate Equestrians (MMD-318484-C-DR-BR-105) (Option 9)

In this option, a footbridge and access ramps will be provided to accommodate pedestrians, together with a cyclists and equestrian. The minimum width of the footbridge and ramps, for a combined equestrian/pedestrian access would be 3.5m (BD29/04) with solid side panels/parapets of 1.8m height to accommodate equestrian use. The construction of ramps will be similar to option 7, but they will not be and

suitable for wheel chairs and people with walking difficulties as discussed above in section 2.4.4.1.

A steel deck is unacceptable due to its noise under equestrian use with the clanging noise made by hooves which could frighten the horses. A timber decking over steel deck plate would be adopted on the bridge and ramps to deaden the sound of horses hooves. Small gaps are recommended in between the decking panels to aid drainage. The requirement for equestrian use on the bridge will require regular cleaning and maintenance. This option does not lead to a safe solution, as there is a possibility of horses being startled while crossing the bridge during train movement. However, this option is still viable should be considered in the next GRIP stage for further development. With an alternate route available, it is considered likely that riders would prefer to use a larger bridge (bypass route) rather than small steel pedestrian footbridge.

#### **Footbridge Form and Construction**

The bridge construction will require a night closure or a day possession during the weekend. The possession requirement and restricted site access will limit the amount of work and time on site and will require as much prefabrication as possible. A steel bridge is considered to be the best option as it can be installed in a single lift operation in a limited possession time. The Network Rail standard U-frame steel bridge is the preferred option due to its long term success and popularity. The bridge should include a minimum 1.5m high steel clad restraint system for pedestrians or 1.8m high for equestrians.

#### **3.2.3.4 Subway with approach ramps (MMD-318484-C-DR-BR- 101) (Option 10)**

An alternative is to construct a subway with approach ramps under the existing platforms and tracks. As the existing level crossing is a designated bridleway route, this underpass option will accommodate equestrians along with pedestrians and cyclists. The structure will be a precast reinforced concrete box with a width and headroom clearance (mounted access) of 5.0m and 3.5m respectively as specified in BD29/04 in compliance with IAN 124/11. It is proposed to provide chamfers at the bottom of subway for pedestrian safety. There is

another option of reducing the headroom of the structure to 2.7m, but this would restrict equestrians to dismounted access. Equality Act 2010 compliant ramps associated with the structure will require approximately 90m long ramps (based on full mounted equestrian access) which will require substantial land acquisition to create the length of path needed for such a height gain and fall.

### **Construction Issues**

The main issues that would be involved in the construction of a subway are:

- The subway will be constructed under the existing tracks, which will stop train movements during the construction period;
- The subway will be constructed under the existing platforms. This option will not be feasible if platforms are founded on piles (not likely);
- The available data shows no presence of existing services but unforeseen obstructions i.e. HV cables could have a great impact on the construction cost and timescale;
- Due to high groundwater table level, other issues involving possible flooding during construction and the high cost of maintenance are similar to an underpass option as already discussed in section 2.4.2 above. These issues will increase financial cost and preclude this from further consideration.

The estimated construction cost of these options is given in section 7.1.

### **Equestrian Route**

Equestrian right of way must be consideration, following the closure of Foxton level crossing. Below is a summary of equestrian route options considered as part of this study.

At the existing level crossing, equestrian have been consider in:

- Option 9 - Footbridge with approach ramps to accommodate equestrian;

- Option 10 - Subway with approach ramps.

Alternative to the above options, equestrian will be directed to use the by-pass route option (Route C).

## 4 Development Requirements for the Existing Equipment

### 4.1 Survey & Mapping

Refer to 'Topographic Survey Specification Report' in Appendix 'N'

### 4.2 Electrification and Plant

#### **Drawing MMD-318484-C-DR-HW-07**

- The road lighting will be designed in accordance with BS5489-1; 2013;
- The design will take into account the surrounding area and any environmental issues;
- Where necessary the lighting will be integrated with the existing road lighting;
- All lighting will conform to the Local Authority's standards;
- Lighting adjacent to the railway will be provided by full cut-off flat glass lanterns, taking in to account Network Rail standards and requirements.

#### **Drawing MMD-318484-C-DR-BR-101 & 102**

- Lighting adjacent to the railway will be provided by full cut-off flat glass lanterns, taking into account Network Rail standards and requirements;
- Lighting to the footbridge across the tracks will be provided by low level lighting contained within the bridge structure;
- All lighting levels provided for accessible routes will be in accordance with the Equalities Act 2010.

#### **Subway**

- Lighting adjacent to the railway will be provided by full cut-off flat glass lanterns, taking into account Network Rail standards and requirements;
- All lighting levels provided for accessible routes will be in accordance with the Equalities Act 2010;
- Lighting to the subway will include emergency coverage.

### 4.3 Signalling

It is understood that this line is currently scheduled for resignalling, with Foxton LC being renewed as MCB-OD. The following assessment assumes that the crossing is closed prior to this signalling scheme taking place. It should be noted that closure prior to resignalling will entail a cost benefit of approximately £1M."

The assets requiring alteration are as follows:

- Foxton Gate Box;
- Foxton Interlocking;
- Cambridge PSB relay room;
- Cambridge PSB control panel;
- Interlocking interface.

This assessment has been undertaken as a desktop study using information provided by Network Rail in the form of Signalling Infrastructure Condition Assessment (SICA) reports. The findings are as follows:

**Foxton Gate Box.** This was the subject of a secondary SICA inspection on 13<sup>th</sup> December 2012 (Report ref. NR/AN/SIG/ACR/12-13/40). Foxton Gate Box will be made fully redundant by these works and will therefore be decommissioned. There is no listed structure in close proximity which could affect the proposed scheme. The level crossing was completely renewed in 1998, with further minor renewals and additions in 2012. The wiring is classified as Normal and all equipment is in a generally good condition.

**Foxton Interlocking.** This was the subject of a secondary SICA inspection on 16<sup>th</sup> January 2013 (Report ref. NR/AN/SIG/ACR/12-13/53). Foxton interlocking will require alteration to remove the slotting controls on signals 113 and 114. The interlocking dates from 1983 and the overall category of the wiring is poor due to significant dry degradation. The risk of disruption due to wire damage is significant. Alterations to this interlocking will therefore require special measures to ensure that unaffected circuits are not damaged. The technician's

indication panel will also require updating to remove the level crossing. This consists of a single-piece fascia which is in good condition.

Cambridge PSB relay room. This was the subject of a secondary SICA inspection on 25<sup>th</sup> February 2010 (Report ref. NR/AN/SIG/ACR/10/09). Alterations will be required to recover the slot indications associated with the level crossing. The interlocking dates from 1983, with wiring of the geographical sets classified as Fair but other wiring classified as Poor due to dry degradation. The limited nature of the alterations suggests that the risk of disruption due to wire damage is low.

Cambridge PSB control panel. This is assessed in the same report as the relay room and its overall condition is considered to be good. The panel is an Entrance-Exit (NX) type panel of domino tile construction. Alterations to remove the level crossing and slot indications will be required.

Interlocking interface. This is provided via a GETS Delphin 1024 TDM provided in 2010. This equipment will be suitable for alteration.

### **Signal Sighting Issues**

The road bridge is currently planned to be positioned above 1038B and 1039A points. Whilst the OLE design would normally prohibit points under bridges, the crossover (1039) and siding connection (1038) are not electrified. The closest signal on the Up Royston line is CA114, located on Foxtton station platform. Sighting of this signal will not be affected by the road bridge. The signal ahead, CA110, is located at Shepreth station, 1990 yards beyond CA114. This signal will not be affected by the road bridge. The Down Royston signal closest to the road bridge is CA113, located 808 yards on the approach to the level crossing, placing the bridge between the signal and the crossing. The signal ahead of the bridge, CA115, is not visible from Foxtton station. As a result of the above, the current planned road bridge has no impact on signal sighting.

The current design of the footbridge, as depicted on drawing MMD-318484-C-DR-BR-01, shows the bridge deck approximately above CA114 signal with the DDA-compliant ramps on the outside of the platform. This signal is approached along a gradual right-hand curve

with the last 200 yards or so being straight. This information has been deduced from Google Earth and Google Street view. This arrangement means that the current bridge design should not adversely impact the sighting of CA114, although this will be subject to a formal signal sighting committee at a later development stage. This may be undertaken using the Bentley signal sighting tool applied to a Building Information Management (BIM) model of the bridge design prior to construction. No other signals are affected.

#### 4.4 Telecoms

##### 4.4.1 Operational

The proposed works will have no effect on the existing Track/P' way alignment and signal sighting.

At the existing level crossing point it is proposed to provide a palisade fence gate controlled by Network Rail which will be used as a railway access point (RAP) for future Track/ P'way maintenance

It is understood that the existing gate box is to be made fully redundant and decommissioned. Any associated telephones and fax machines contained therein will be recovered and handed back to the maintainer as maintenance spares if required.

Once the level crossing has been decommissioned any existing emergency telephones will also be recovered and handed back to the maintainer as maintenance spares if required.

Any GSM-R coverage issues (e.g., the provision of lifts and/or footbridge) will be investigated at the GRIP 4 stage of the project and the requirements of Project Advice Notes PAN/E/TE/FT/0060 and PAN/E/TE/FT/0061 will be required to be adhered to.

##### 4.4.2 SISS

###### Telecommunications – SISS

Site visits were carried out by others and the following conclusions reached:

#### Closed Circuit Television (CCTV)

There is currently no CCTV coverage of the station, although there is coverage of the level crossing. It is understood that at present the CCTV is provided by Cambridge County Council or the police to monitor movements at existing level crossing and is not part of the NR infrastructure.

#### Customer Information System (CIS)

There are currently two existing CIS Information Boards at the station. One Next Train Indicator (NTI) is located on the shelter of Platform 1 and a Next Train Indicator is located on a gallows post on Platform 2. The indicator displays appear to be new but at the time of a site visit did not appear to be working correctly.

The customer information systems appeared to be in good condition but their life expectancy and the condition of the associated cabling cannot be confirmed.

#### Public Address (PA)

There are a number of PA speakers on both Platforms 1 & 2 and as the station is unmanned these are thought to be Long Line Public Address (LLPA), but it has not been confirmed from where the announcements are made.

The public address (PA) appears to be in good condition, but will require maintaining. The life expectancy and the condition of the associated cabling cannot be confirmed.

#### Passenger Help Point (PHP)

There is an existing help point at the station on Platform 1, only sited on the wall of the shelter.

The PHP appears to be in good condition, but is understood not to be working and will require maintaining. The life expectancy and the condition of the associated cabling cannot be confirmed.

### Proposed Telecoms Options

As there is currently no CCTV coverage at the station, it is assumed that the addition to any existing CCTV system or the provision of any new CCTV system will be the responsibility of the TOC.

### **New Subway**

#### CCTV

CCTV coverage will be required in order to view the top and bottom of the ramps leading to and from Platforms 1 and 2 and at each end of the underpass covering its length.

It is proposed that CCTV coverage will consist of a camera looking at the ramps leading to and from Platforms 1 and 2 and two cameras at each end of the underpass covering its length.

#### Customer Information Systems

There is an option to provide new NTI screens at the top of each ramp leading to and from Platforms 1 and 2 in order to inform passengers as to which platform their train is arriving/departing from and the time of the next train from that platform.

It is proposed that one new CIS screen will be provided at the top of each of the ramps leading to and from Platforms 1 and 2 and will be of the same type as the existing.

#### Public Address

New PA speakers will be required within the new underpass in order to inform passengers as to which platform their train is arriving/departing from and of any delays/disruptions to services.

It is proposed that a new PA speaker will be provided within the underpass.

#### PHP

There will no requirement for PHP units within the new underpass.

### **New footbridge and Ramps**

#### CCTV

CCTV coverage will be required in order to view the stairs leading to and from Platforms 1 and 2, covering the footbridge itself.

It is proposed that the CCTV coverage will consist of two cameras looking at the stairs leading to and from Platform 2, one camera looking at the stairs leading to and from Platform 1, and two cameras at each end of the footbridge covering its length.

#### Customer Information Systems

There is an option to provide new NTI screens at the top of each ramp leading to and from Platforms 1 and 2 in order to inform passengers as to which platform their train is arriving/departing from, and the time of the next train from that platform.

#### Public Address

There will not be a requirement for PA speakers on the footbridge or the ramps.

#### PHP

There will not be a requirement for PHP units on the footbridge or the ramps.

### **New footbridge with lifts**

#### CCTV

CCTV coverage will be required in order to view the stairs leading to and from Platforms 1 and 2, the lifts and the footbridge.

CCTV coverage will also be required within each lift.

It is proposed that CCTV coverage will consist of a camera at ground level looking at the stairs leading to and from Platforms 1 and 2, a camera at ground level looking at the lifts leading to and from Platforms

1 and 2, two cameras on the footbridge covering the lifts and top of the stairs, and two cameras at each end of the footbridge covering its length.

A new camera will be provided within each lift as part of the lift build.

#### Customer Information Systems

There is an option to provide new NTI screens at the bottom of the stairs and the bottom of the ramps, in order to inform passengers as to which platform their train is arriving/departing from, and the time of the next train from that platform.

#### Public Address

There will not be a requirement for PHP units on the footbridge or the ramps or within the lifts.

#### PHP

A new assistance unit will be required within each lift as part of the lift build.

### 4.5 Track

Due to the existing condition of the track over the crossing, it is proposed to replace 18m (60 feet) length of track over the level crossing.

### 4.6 Vehicle Incursion Measures

This study considers the following measures to improve road safety and mitigate risk of vehicle incursion:

1. Appropriate road signage will be provided on both sides of the existing level crossing, at the proposed A10 tie-in as well as at the blocked off location to confirm new layout.
2. Vehicle access to the existing level crossing will be made impossible with permanent kerbs and protection bollards (if deemed necessary).

3. When the new alternative for pedestrian crossing is constructed, the existing level crossing route will be permanently blocked for pedestrians by installing 1.8m high steel palisade fence.
4. Driver's visibility at night will be improved by illuminating the area with an appropriate lighting system.
5. The new A10 by-pass route will be protected by the appropriate class of safety barriers on either side to prevent errant vehicles falling from the embankment or encroach into cutting.
6. Road gradients and bend radii are designed to improve visibility, thus reducing probability of accidents.
7. Wider footways on the bridge will be proposed to reduce risk and give drivers extra width to avoid accidents.
8. For an overbridge option, a high containment parapet (1.8m high) is proposed at each side of the structure continuing past the abutment and connecting with the highway safety fence by means of transition.

#### 4.7 Platform Gauging Compliance

Based on the platform gauging information provided by Network Rail, the existing platforms at Foxton Station are non-compliant. These should be brought up to current standard when the proposed platform extension improvement works are planned.

Refer to Appendix 'Q' for platform gauging data.

Since the work proposed in this work scope is outside the boundary of platforms, there is no effect on existing platform gauging.

#### 4.8 Drainage

There are open watercourses on 3 sides of the site (north, east and west) within a distance of 1km from the current crossing point. Based on the available sewer records, there appears to be no public surface water drains in the vicinity of the site. There may be some local streams or tributaries that drain the surface water of the area to these watercourses. These will need to be confirmed at the next stage of the project via consultation with the Local Authorities and site visits. The flooding potential of these local streams, if present, and their impacts to the proposal will need to be assessed.

The available sewer records show only foul drains present in the vicinity of the current crossing point. They are generally of 150mm diameter. There appears to be a pumping station located next to the existing crossing point. The local foul sewers are draining to this pumping station and a 250mm dia. rising main is also connecting to it from the east. From the pumping station, twin rising mains take the flow to the west. No information on the depths of the foul sewers and rising mains is available at present.

### **Potential Flood and Drainage Impacts of the Proposed Options**

#### Overbridge Option

The approximately 0.5km long embankment will alter the current surface water overland flow paths. The impacts of this are not known at this stage and will need to be assessed at the next stage of the project. There may be requirements to provide culvert crossings underneath the embankment to maintain the current flow conditions. Similarly, if there are existing local watercourses draining the area which are disturbed by the embankment proposal, they will also need to be diverted. This will need confirmation at the next stage of the project.

Part of the embankment will be constructed on top of the existing foul sewers and rising mains. Anglian Water will need to be consulted on the proposals and they may require diversion of these services for the construction of the proposed works. Similarly, the proposed embankment may also affect other services serving the existing pumping station such as signalling and power cables. These services will also need to be positioned if affected.

For the new road itself, the new paved area will generate additional surface water runoff and it should not be discharged to the foul system unless Anglian Water agrees to it. Consultation with Anglian Water will need to be made at the next stage of the project on this matter. If it is confirmed not acceptable to drain to the foul system, alternative options including a soak away, draining to the local, or other nearby, watercourses will need to be considered.

### Underpass Option

Most of the impact of the overbridge option, including its impact on existing overland flow paths, and additional surface water generated by the new paved surface also applies to the underpass option. However, the underpass option will very likely require diversions of the existing sewers and rising mains where the new cutting intercepts with these services. The scale of the diversion works required are also expected to be more significant than that required for the overbridge option, as the new sewer alignments will need to clear the cutting area.

For draining the new underpass, pumping facilities will probably be required. As with the overbridge option, the outfall for the additional runoff will need to be investigated.

## 5 Environment and Ecological Study

### 5.1 Environmental appraisal

Refer to Appendix 'R' for 'Environmental Appraisal and Action Plan'.

### 5.2 Ecological Constraints Study

Refer to Appendix 'S' for 'Ecological Constraints Study'.

## 6 Programme and Construction Methodology

### 6.1 Disruption to Rail Operations

None

#### 6.1.1 Existing possession opportunities

The underpass structure option will be constructed adjacent to the rail embankment. The bridge will be installed using a box jacking technique, and will approximately require 65 hour blockade of the line during Easter or Christmas period. This possession duration is too long for operational requirement and against the Network Rail's policy of possessions. For this reason, the underpass solution is not considered as a viable option and is not considered for further development.

The substructure of the overbridge can be constructed in a separated green zone working, but the installation of the superstructure will require approximately a 24 hour possession plus other ROR possessions which can be achieved during the weekend blockade.

Recent possession planning meeting held at the end of April 2013 identified the following possessions are available on this line:

- 4no 27hours weekend possession in October 2017;
- 2no 27 hours weekend possessions in December 2017.

The following is the extract from the Network Rail Engineering Access statement for 2013 version 4.2 and 2014 version 2 that shows possession opportunities for the route between Royston to Shepreth Branch Junction.

## 6.2 Indicative construction programme

The route options considered will have a similar construction programme. The construction programme is prepared based on the options of approach embankments or cutting.

Refer to 'Appendix I' for indicative construction programme.

### 6.2.1 Construction Sequence

Once the construction site is mobilized:

- Remove site constraints and divert required services.
- Construct new bypass route;
- Divert A10 traffic to new route;
- Close A10 road for traffic at existing level crossing by installing proposed incursion protection;
- Construct footbridge foundations and supports with associated ramps or lift shafts;
- Block existing level crossing with palisade fence;
- During a night possession, remove OLE and install footbridge;
- Reinstate OLE to reduce height below the bridge.

## 6.3 Reliability and maintainability

Removal of the crossing asset reduces the scope for problems occurring and on-going maintenance of the asset.

# 7 Cost Estimates

## 7.1 Option cost estimates

Estimates have been developed for the options identified, based on assumptions and exclusions mention in section 7.2.

Contingencies of 30% and 40% are considered for the main bridge options and pedestrian access options respectively. Estimates are detailed in Appendix 'E' and are summarised below, (\*Estimated cost not calculated as the options are unfeasible).

Route Options	Estimated Cost
Route C1 based on Overbridge Option	£ 13,200,000
Route C1 based on Underpass Option	£ 21,150,000
*Route C2 based on Overbridge Option	-
*Route C2 based on Underpass Option	-
*Route C3 based on Overbridge Option	-
*Route C3 based on Underpass Option	-
Route C4 based on Overbridge Option	£ 11,650,000
Route C4 based on Underpass Option	£ 19,170,000
<b>Structure Options - Pedestrian/Cycleway Crossing</b>	
Footbridge with Ramps	£ 3,000,000
Footbridge & Lift shafts - straight stairs	£ 2,300,000
Footbridge & Lift shafts - Compact stairs	£ 2,400,000
Footbridge with Ramps for Equestrians	£ 4,500,000
Subway/Bridleway with Ramps	£ 3,100,000

## 7.2 Assumptions and exclusions

The assumptions and exclusions are included within the cost estimates detailed in Appendix 'E'.

## 7.3 Risk

Main risks applicable to all options are as follows:

1. Land acquisition;
2. Existing buried services;
3. Exceptional inclement weather during construction;
4. Estimate variance.

Refer to Appendix 'F' for detailed description.

# 8 Consultation

## 8.1 Stakeholders

The primary groups of stakeholders identified so far for this scheme include full Network Rail list are:

**a. Internal:**

- Sponsors
- Network Operations
- RAM Team
- Foxton Maintenance Depot
- Maintenance
- Operations Manager
- ORA Team and Level Crossing Manager
- Liabilities Manager
- Network Strategy and Planning
- IP Anglia

**b. External:**

- ORR
- DfT
- FCC
- FOCs
- Barrington Cement Works
- Local Authority (CCC)
- Highways Agency
- Local Residents
- Road Users
- Rail Users
- Adjoining Landowners
- Utilities
- Environment Agency
- Natural England
- Protection for Rural England
- Cycle User Groups
- Equine User Groups (British Horse Society)
- Pedestrians/Ramblers

**c. CDM Stakeholders:**

- Client
- Clients Representative
- CDM Coordinator
- Designer
- Principal Contractor

## 9 Discussion Summary

### Options Comparison Summary

Route	Advantages	Disadvantages
<b>Route A</b>	<ol style="list-style-type: none"> <li>1. Relatively short span bridge</li> <li>2. No additional structure required for pedestrians and equestrians at the level crossing.</li> <li>3. Minimises the requirement of land acquisition.</li> <li>4. No significant cost compared to bypass options.</li> </ol>	<ol style="list-style-type: none"> <li>1. Disruption to the A10 traffic. The A10 will have to be closed for a significant period (over 18 months), with traffic being diverted via A1198 and B603 to the north or via A505 to the south for the duration of the construction period.</li> <li>2. Diversion of existing services is unavoidable and expensive for both the flyover and underbridge options.</li> <li>3. Frontage access to existing dwelling adjacent to the A10 will be severely restricted, due to the embankment or retaining structure required to support/retain the adjacent ground from the road.</li> <li>4. In order to accommodate this option, two properties (No.2 Barrington Road and No.4 Royston Road) adjacent to the level crossing will need to be acquired and demolished.</li> <li>5. Noise and dust emissions due to demolition and construction.</li> <li>6. The overbridge flyover headroom will be higher due to higher OLE at the existing level crossing location.</li> <li>7. Station Road will be permanently closed.</li> <li>8. There will be considerable disruption to rail services during construction.</li> <li>9. Future extension of platforms will be affected.</li> </ol>

Route	Advantages	Disadvantages
<b>Route B</b>	None	<ol style="list-style-type: none"> <li>1. Clash with existing residential properties (approx. 10. No. properties will be affected).</li> <li>2. Noise and dust emission levels during construction would be high.</li> <li>3. Diversion of existing services is unavoidable and will have significant cost implication.</li> <li>4. Existing of station would require long span crossing over the existing platforms.</li> <li>5. Station Road is a main route to Foxton Village Centre, this route option will require alternate route to Station Road.</li> </ol>

Route C Sub-Routes			
Options	Estimated Cost	Advantages	Disadvantages
Sub-Route C1	£13,200,000 (overpass)	1. Designed to maintain existing design speed. 2. Cheaper than route C3.	1. Relatively bigger structural span (32.6m). 2. Significant land acquisition (approximately 45,000 m <sup>2</sup> ).
	£21,150,000 (Underpass)	3. No interface with Network Rail Depot.	3. Interfaces with private property located on Barrington Road. 4. Requires a short retaining structure at Barrington road.
Sub-Route C2	*	1. Slightly shorter route compared than C1. 2. Cheaper than route C1 and C3. 3. No interface with Network Rail Depot.	1. Interfaces with private property located on Barrington road. 2. One step down from current design speed but within limit TD 9/93. 3. Requires a retaining structure at Barrington road.

Route C Sub-Routes			
Options	Estimated Cost	Advantages	Disadvantages
Sub-Route C3	*	<ol style="list-style-type: none"> <li>Least impact on properties.</li> <li>No requirement of retaining structure.</li> <li>No impact on Network Rail Depot.</li> </ol>	<ol style="list-style-type: none"> <li>Required most land takes (approximately 45,000 m<sup>2</sup>).</li> <li>Largest structural span (54 m).</li> <li>Most expensive of all routes.</li> <li>Longest construction timescale.</li> <li>One step down from current design speed but within limit TD 9/93.</li> </ol>
Sub-Route C4	<p>£ 11,650,000 (Overpass)</p> <p>£ 19,170,000 (Underpass)</p>	<ol style="list-style-type: none"> <li>Cheapest of all options</li> <li>Minimum land take</li> <li>Smallest structural span</li> <li>Shortest of all routes</li> </ol>	<ol style="list-style-type: none"> <li>Interfaces with network rail depot which would require relocation/demolition.</li> <li>Noise and dust emissions due to demolition.</li> <li>One step down from current design speed but within limit TD 9/93.</li> </ol>

Bridge Alternatives			
Options	Estimated Cost	Advantages	Disadvantages
Overbridge Option	£ 2,200,000	<ol style="list-style-type: none"> <li>1. Minimises disruption to rail movements during construction.</li> <li>2. No risk of flooding during construction.</li> <li>3. Minimises the construction programme.</li> <li>4. Cheaper than the underpass option.</li> <li>5. Less chances to interface with buried services.</li> </ol>	<ol style="list-style-type: none"> <li>1. High headroom requirement due to existing OLE.</li> <li>2. High headroom requires high abutments and approach embankments which extensively increase the construction cost.</li> <li>3. High containment parapet is required over the bridge.</li> <li>4. Possible clash with existing overhead power lines.</li> </ol>

Bridge Alternatives			
Options	Estimated Cost	Advantages	Disadvantages
<b>Underpass Option</b>	£ 2,450,000	<ol style="list-style-type: none"> <li>1. Lower headroom requirement.</li> <li>2. Using box jacking method, rapid construction can be done without any disruption to train movements.</li> </ol>	<ol style="list-style-type: none"> <li>1. Box jacking technique requires high level of precision and accuracy.</li> <li>2. Constant monitoring of track levels is required during construction.</li> <li>3. Risk of flooding during excavation due to high water table.</li> <li>4. Risk of flooding will enhance the construction timescale.</li> <li>5. De-watering required during construction due to low water table i.e. 2m from ground level.</li> <li>6. High water table will require permanent pumping station which enhances the cost of this option.</li> <li>7. Diversion of unknown buried services or obstructions would significantly increase the cost and timescale of construction.</li> <li>8. Would require extensive site work due to insitu concrete.</li> </ol>

Pedestrian, Cycle & Bridleway Crossing Alternatives			
Options	Estimated Cost	Advantages	Disadvantages
Pedestrian Footbridge with Equality Act 2010 Ramps	£ 3,000,000	<ol style="list-style-type: none"> <li>1. Easy and cheaper to construct compared to the subway option.</li> <li>2. Prefabricated steel footbridge minimises disruption to train movements.</li> <li>3. Does not require any casting of concrete over the track and is a quick and clean solution.</li> </ol>	<ol style="list-style-type: none"> <li>1. Ramps would require bigger land acquisition.</li> <li>2. Longer ramps will cause significant problems for people with walking difficulties and wheelchair users.</li> <li>3. Capital cost of ramps will be higher than lift shafts.</li> <li>4. Ramp will require departure from standard.</li> <li>5. Cannot accommodate a bridleway.</li> <li>6. Footbridge would require regular inspections and maintenance of bearings.</li> </ol>

Pedestrian, Cycle & Bridleway Crossing Alternatives			
Options	Estimated Cost	Advantages	Disadvantages
Footbridge with Equality Act 2010 Ramps for Pedestrians & Equestrians	£ 4,500,000	<ol style="list-style-type: none"> <li>1. Shorter route for the riders.</li> <li>2. Existing route, familiar to riders and horses.</li> <li>3. Non-traffic route, much safer for the riders.</li> </ol>	<ol style="list-style-type: none"> <li>1. Horses likely to get frightened while crossing the bridge.</li> <li>2. Riders would prefer to choose longer route over small metal bridge.</li> <li>3. Will require wooden decking over the bridge to deaden the noise.</li> <li>4. Inconvenient for pedestrians &amp; cyclists.</li> <li>5. Regular cleaning of ramps &amp; surface.</li> </ol>
Footbridge with Equality Act 2010 Lift shafts	£ 2,400,000	<ol style="list-style-type: none"> <li>1. Cheapest of all options</li> <li>2. Easy and quick to install.</li> <li>3. Minimum land acquisition.</li> <li>4. Convenient for wheel chairs and people with walking difficulties.</li> <li>5. Minimum disturbance to neighbourhood communities.</li> </ol>	<ol style="list-style-type: none"> <li>1. Lift shafts will require constant maintenance to keep it in operation.</li> <li>2. Steel footbridge requires regular painting which will require possession thus increases the whole life costs of the structure.</li> <li>3. Cannot accommodate a bridle way.</li> <li>4. The new steel structure will require earth bonding.</li> </ol>

Pedestrian, Cycle & Bridleway Crossing Alternatives			
Options	Estimated Cost	Advantages	Disadvantages
Equality Act 2010 Compliance Subway	£ 3,100,000	<ol style="list-style-type: none"> <li>1. Subway can accommodate bridleway route.</li> <li>2. Low maintenance cost.</li> <li>3. Lower headroom requirement would minimise ramps length in compliance DDA standard.</li> </ol>	<ol style="list-style-type: none"> <li>1. Most expensive of all options.</li> <li>2. Risk of flooding during excavation due to high water table which is approximately 2m below existing ground level.</li> <li>3. Bigger land acquisition and higher maintenance cost.</li> <li>4. Subway construction will require longer possession compared to other options.</li> <li>5. This will undermine the foundations of existing platform. The option would be unfeasible if platforms are founded on piles.</li> <li>6. Unknown buried services will have an impact on the cost and construction timescale.</li> <li>7. Longer ramps will cause significant problems for people with walking difficulties and wheelchair</li> </ol>

## 9.1 Preferred Options

Based on SIFT study, following options to be considered in GRIP 3 stage. Underpass options have not been forwarded due to the high risks involved during the construction. The matrix produced is attached in Appendix 'B' of the report.

### 9.1.1 Routes

Based on the significant direct effect on the number of residential properties, the Route A and B is considered to be inappropriate, particular with other Route options available for consideration. Therefore, Route B is not considered for further development.

Following a sift exercise, it is concluded that route option C1 and C4 has been put forward for further development. The route option C3 has not been put forward due to its complex construction and high cost.

### 9.1.2 Overbridge Options

- Precast Prestressed Concrete (PPC) Beams on Cantilever abutments (Option 1)
- Integral Bridge on bankseat abutments (Option 2)
- Integral Bridge on bankseat abutments (Option 3)

### 9.1.3 Underbridge Options

None

### 9.1.4 Pedestrian Access Options

- Footbridge with approach ramps and stairs (Option 7).
- Footbridge with lift shafts and stairs (Option 8).
- Footbridge with approach for pedestrian and equestrians (Option 9).

## 10 Conclusion and Recommendations for Further Work

The feasibility study of existing level crossing closure identified three main routes A-C. Route C is divided into four sub-route options, and each route discusses the opportunity of underpass or overpass, across the railway lines. All routes have been evaluated and their strength, weaknesses, opportunities and threats are highlighted in Appendix 'A'. Risks and opportunities that have arisen from the study are detailed in Appendix 'F' of this report.

Route A (online) & Route B (bypass south side) has been discounted at early stage because these present the least attractive solutions in terms of disruption to vehicular users along the A10, and potential demolition of up to 10 residential properties along the proposed line of the by-pass respectively. The remaining Route C, was further developed and an outline estimated cost (Refer to Section 7) was produced to compare the cost of sub-options C1 & C4 which were deemed the most favourable sub-options. Sub-option C3 was determined to be the most expensive solution due to its larger curve radius which in turn extended the limit of the works and increased the difficulties due to the larger bridge span. This route avoids the interface with existing Network Rail Depot but the benefits achieved versus cost comparison is not significant therefore this route is not taken forward to the next GRIP stage. Further consideration was given to develop routes with an approach cutting or embankment. The study concluded that an approach cutting with an underpass option is more problematic to construct due to the presence of high water table and will require a permanent pumping system within the cutting area, with considerable long term financial maintenance impact.

During the bridge option development an RC box insitu construction was considered at early stage but was discounted due to the extensive concreting and possession requirements. The bridge feasibility considers a solution which involves as much prefabrication as possible to minimise disruption to rail movements. The overbridge options are economical and simple to construct and will require less possession time when compared to an underpass solution. The estimated cost of the overbridge is 18.5% less than underpass for the same route. The estimated cost of an overbridge and underbridge proposal is given as below:

Overbridge Option	Underpass Option
£2,000,000	£2,450,000

The increased cost of an underpass option is mainly due to the significant excavation and it is anticipated that the construction work programme for the underpass structure will be longer than overbridge solution (refer to Appendix 'E' for estimated construction work programmes). It is concluded that an underpass solution is an undesirable option due to its complex construction and increased capital and maintenance cost.

Different overbridge options were discussed in the report (refer to section 2.4.1), but it is not intended to draw specific conclusion or make recommendations on the choice of bridge type at this stage. This study will allow the next GRIP stage to develop these options further and conclude the optimum solution.

The report has also identifies a preferred location for the construction of a new footbridge or subway at existing level crossing. Provision of providing a combine footbridge for bridleway and pedestrian has been anticipated over the existing level crossing but this would significantly increases the capital cost of the structure and is a serious safety risk. The option of 'Footbridge with ramp approaches and stairways' is considered as an unfeasible alternative due to the requirement for excessive ramp lengths adding to the construction cost. Moreover, this option does not compliance fully with Equality Act 2010 requirements and will require departure for acceptance. A tunnel/subway option may incur excessive costs due to unforeseen site constraints and unfavourable ground conditions. The works programme to construct the subway will be considerably longer and will require a longer possession of the track when compared to alternatives. A footbridge with lift shafts is considered to be a preferred alternative as it provides simple and cost effective solution, so this option is sifted for further development.

The recommendation of the above options is based on a number of considerations that have been taken into account to achieve the most suitable form of structure for the client, road users, construction issues

and the surrounding environment. The options recommended for further development are summarised in the SIFT sheet (refer Appendix 'B').

In order to progress the work we recommend the review of the following key issues in the next GRIP stage,

- Undertake detail ground investigation and prepare a factual report based on the investigation.
- Carry out a topographic survey of areas where the proposed intervention impacts on existing infrastructure or external land owners.
- Investigate the existing buried services and negotiate with the land owners.
- Carry out an outline design of the structure, to facilitate early acceptance from key stakeholders.
- Consult with the local community.

# Appendix A. Strengths Weaknesses Opportunities and Threats (SWOT) Analysis

Options	Description	Strengths and Opportunities	Weaknesses and Threats
<b>Do Nothing</b>	No change from the existing	<ul style="list-style-type: none"> <li>No infrastructure works required.</li> <li>No blockade or possession requirements.</li> <li>No requirement of land acquisition.</li> </ul>	<ul style="list-style-type: none"> <li>Does not meet the basic objectives of the study.</li> <li>Safety risk to the public.</li> <li>Disruption to A10 traffic.</li> <li>Weakness to the operation of Train Operating Companies.</li> </ul>
<b>Route A</b>	On-line Grade Separation	<ul style="list-style-type: none"> <li>No additional structure requirement for pedestrians, cyclist and bridleways.</li> <li>Can achieve the requirement with minimal investment compared to other options.</li> <li>Minimum land acquisition.</li> <li>Relatively smaller bridge span.</li> </ul>	<ul style="list-style-type: none"> <li>Disruption to the A10 traffic. The A10 will have to be closed for a significant period (over 18 months), with traffic being diverted via A1198 and B603 to the north or via A505 to the south for the during the construction period.</li> <li>Presence of existing services makes this expensive for both over and underbridge options.</li> <li>Demolition of existing houses adjacent to the level crossing.</li> <li>Noise and dust emission due to demolition.</li> <li>Would have an effect on future extension of platforms.</li> <li>Station Road will be permanently closed.</li> <li>충엄업 siderable disruption to rail services during construction.</li> </ul>
<b>Route B</b>	Bypass-South Side	<ul style="list-style-type: none"> <li>Bridge would span over two track lines resulting in shorter span of the structure.</li> </ul>	<ul style="list-style-type: none"> <li>Interface with existing residential dwellings requiring demolition.</li> <li>Noise and dust emission due to demolition.</li> <li>Diversions of existing services are unavoidable and possibly would increase the cost of the scheme.</li> <li>May result in longer route in order to avoid existing station.</li> </ul>
<b>Sub-Route C1</b>	Bypass-North Side	<ul style="list-style-type: none"> <li>Designed to maintain existing design speed.</li> <li>Shorter Route than Sub-Route C3.</li> <li>Minimal effect on Network Rail Depot.</li> </ul>	<ul style="list-style-type: none"> <li>Relatively bigger structure span than c2 and C4.</li> <li>Large land acquisition compared to C4.</li> <li>Interfaces with private property located on the Barrington Road.</li> <li>Requires a short retaining structure at Barrington road.</li> <li>Will be cheaper than C3 but expensive than C2 and C4.</li> </ul>
<b>Sub-Route C2</b>	Bypass-North Side	<ul style="list-style-type: none"> <li>Slightly shorter route compared to C1.</li> <li>Cheaper than route C1 and C3.</li> <li>Minimal effect on Network Rail Depot.</li> </ul>	<ul style="list-style-type: none"> <li>Interfaces with private property located on Barrington road.</li> <li>One step down from current design speed but within limit TD 9/93.</li> <li>Requires a retaining structure at Barrington road</li> </ul>
<b>Sub-Route C3</b>	Bypass-North Side	<ul style="list-style-type: none"> <li>Least impact on properties.</li> <li>No requirement of retaining structures.</li> <li>No impact on Network Rail Depot.</li> </ul>	<ul style="list-style-type: none"> <li>Required maximum land take.</li> <li>Would require large span structure.</li> <li>Most expensive of all routes.</li> <li>Enhance construction timescale.</li> <li>One step down from current design speed but within limit TD 9/93.</li> </ul>

Options	Description	Strengths and Opportunities	Weaknesses and Threats
Sub-Route C4	Bypass-North Side	<ul style="list-style-type: none"> <li>▪ Cheapest of all options.</li> <li>▪ Minimum land take.</li> <li>▪ Small structure span.</li> <li>▪ Shortest of all routes.</li> </ul>	<ul style="list-style-type: none"> <li>▪ Interfaces with network rail depot which would require demolition.</li> <li>▪ Noise and dust emissions due to demolition.</li> <li>▪ One step down from current design speed but within limit TD 9/93.</li> </ul>
<b>Bridge Alternatives</b>			
Option 1	Simply supported deck - Prestress beams	<ul style="list-style-type: none"> <li>▪ Low maintenance cost compared to steel construction but higher than integral form of construction.</li> <li>▪ Horizontal thrust will be lowered on substructure and foundations compared to integral options.</li> </ul>	<ul style="list-style-type: none"> <li>▪ Large amount of crane lifts during erection.</li> <li>▪ High volume of insitu concrete.</li> <li>▪ Maintenance cost due to bearings and movement joints.</li> <li>▪ Prestress beams are heavier than steel beams.</li> <li>▪ Higher construction depth compared to Integral/semi-integral options.</li> <li>▪ Would require longer construction time scale compared to integral for of construction.</li> </ul>
Option 2	Fully Integral bridge on bank seats	<ul style="list-style-type: none"> <li>▪ Minimum maintenance cost.</li> <li>▪ Minimises insitu concreting for the substructure.</li> <li>▪ Relatively less vertical load on the foundations.</li> <li>▪ Minimal construction depth of the structure.</li> <li>▪ Easy to demolish due to less smaller substructure.</li> </ul>	<ul style="list-style-type: none"> <li>▪ This form would significantly increase the structural span.</li> <li>▪ Longer span is likely to increase the cost of the structure compared to other options.</li> </ul>
Option 3	Semi -integral bridge on bank seats	<ul style="list-style-type: none"> <li>▪ Can be constructed on soft ground.</li> <li>▪ Low construction depth.</li> <li>▪ Low maintenance cost</li> <li>▪ Easy to demolish</li> <li>▪ Simple rapid &amp; safe construction.</li> <li>▪ Reduce need for piles or foundation improvement.</li> <li>▪ Less volume of concrete compared to alternatives.</li> <li>▪ Panels can be modified on site to suit geometric constraints.</li> <li>▪ No requirement for scaffolding &amp; formwork during installation.</li> </ul>	<ul style="list-style-type: none"> <li>▪ Drainage outlets are required to prevent settlement.</li> <li>▪ No cracks or warning of settlement is apparent on the structure.</li> </ul>
Option 4	Steel Composite Deck.	<ul style="list-style-type: none"> <li>▪ Easy to pre-camber during fabrication.</li> <li>▪ Due to its lighter weight, smaller crane may be use during erection.</li> <li>▪ Easy transportation and rapid erection.</li> <li>▪ Shallow construction depth compared to prestress beams.</li> </ul>	<ul style="list-style-type: none"> <li>▪ Bracing between beams is required for their stability during erection.</li> <li>▪ Higher long term maintenance cost.</li> </ul>

Options	Description	Strengths and Opportunities	Weaknesses and Threats
<b>Option 5 &amp; 6</b>	<b>Underpass Options</b>	<ul style="list-style-type: none"> <li>▪ Lower headroom requirement compared to overbridge.</li> <li>▪ Using box jacking method, rapid construction can be done without any disruption to train movements.</li> </ul>	<ul style="list-style-type: none"> <li>▪ Box jacking technique requires high level of precision and accuracy.</li> <li>▪ Constant monitoring of track levels is required during construction.</li> <li>▪ Diversion of unknown buried services or obstructions would significantly increase the cost and timescale of construction.</li> <li>▪ Risk of flooding during excavation would require de-watering works which will enhance the construction time scale.</li> <li>▪ High water table will require permanent pumping station which enhances the cost of this option.</li> <li>▪ Would require extensive site work due to insitu concrete.</li> </ul>
<b>Pedestrian/Cyclists/Equestrian Crossing Alternatives</b>			
<b>Option 7</b>	<b>Footbridge with Equality Act 2010 Ramps</b>	<ul style="list-style-type: none"> <li>▪ Easy and cheaper to construct compared to the subway option.</li> <li>▪ Prefabricated steel footbridge minimises disruption to train movements.</li> <li>▪ Does not require any casting of concrete over the track and is a quick and clean solution.</li> </ul>	<ul style="list-style-type: none"> <li>▪ Ramps would require bigger land acquisition.</li> <li>▪ Longer ramps will cause significant problems for people with walking difficulties and wheelchair users.</li> <li>▪ Capital cost of ramps will be higher than lift shafts.</li> <li>▪ Ramp may require departure from standard.</li> <li>▪ Cannot accommodate a bridleway.</li> <li>▪ Footbridge would require regular inspections and maintenance of bearings.</li> </ul>
<b>Option 8</b>	<b>Footbridge with Equality Act 2010 lift shaft</b>	<ul style="list-style-type: none"> <li>▪ Cheapest of all options</li> <li>▪ Easy and quick to install.</li> <li>▪ Minimum land acquisition.</li> <li>▪ Convenient for wheel chairs and people with walking difficulties.</li> <li>▪ Minimum disturbance to neighbourhood communities.</li> </ul>	<ul style="list-style-type: none"> <li>▪ Lift shafts would require constant monitoring/maintenance to keep it in operation.</li> <li>▪ Steel footbridge requires regular painting which will require possession thus increases the whole life costs of the structure.</li> <li>▪ Cannot accommodate a bridle way.</li> <li>▪ The new steel structure will require earth bonding.</li> </ul>

<p><b>Option 9</b></p>	<p style="text-align: center;"><b>Footbridge with ramps for Pedestrians/Cyclists/Equestrians</b></p>	<ul style="list-style-type: none"> <li>▪ Allow equestrians to cross the railway at or close to existing bridleway route.</li> <li>▪ Prefabricated steel footbridge minimises disruption to train movements.</li> <li>▪ Does not require any casting of concrete over the track and is a quick and clean solution.</li> </ul>	<ul style="list-style-type: none"> <li>▪ Ramps would require bigger land acquisition.</li> <li>▪ Longer ramps will cause significant problems for people with walking difficulties and wheelchair users.</li> <li>▪ Wider footbridge and ramps to accommodate equestrians as well as pedestrians, hence capital cost will be higher.</li> <li>▪ Ramp may require departure from standard.</li> <li>▪ Risk of horses being frightened by passing train, while they are crossing the bridge.</li> <li>▪ Potential higher daily maintenance required to remove horse excrement.</li> <li>▪ Potential requirement for additional wooden decking to reduce noise from horse crossing the steel deck.</li> <li>▪ Footbridge would require regular inspections and maintenance of bearings.</li> </ul>
<p><b>Option 10</b></p>	<p style="text-align: center;"><b>Subway with Equality Act 2010 Ramps</b></p>	<ul style="list-style-type: none"> <li>▪ Subway can accommodate bridleway route.</li> <li>▪ Low maintenance cost.</li> <li>▪ Lower headroom requirement would minimise ramps length in compliance DDA standard.</li> </ul>	<ul style="list-style-type: none"> <li>▪ Most expensive of all options.</li> <li>▪ Risk of flooding during excavation due to high water table which is approximately 2m below existing ground level.</li> <li>▪ Bigger land acquisition and higher maintenance cost.</li> <li>▪ Subway construction will require longer possession compared to other options.</li> <li>▪ This will undermine the foundations of existing platform. The option would be unfeasible if platforms are founded on piles.</li> <li>▪ Unknown buried services will have an impact on the cost and construction timescale.</li> <li>▪ Longer ramps will cause significant problems for people with walking difficulties and wheelchair users.</li> </ul>

## Appendix B. SIFT Determination

Project	318484
Intervention	Foxton
Grip Stage	2

Key	
	High Impact, not beneficial or does not meet basic requirement
	Neutral;no significant effect;middle cost effect (relative to options considered)
	Meets requirement;beneficial;low capital cost (relative to options considered)
	Carry forward to Next GRIP Stage
	Option dismissed - due to the clear fact the option is not practical.
	Option dismissed with stakeholders' agreement

Option	Option Type	Operational Flexibility	Capital Cost	Construction Methodology	Construction Access	Disruption to Rail Operations	Impact on third Parties	Benefit Realisation	Environmental Constraints	Land Intake	System Safety	Stakeholder Issues	Consents Required	Performance	Operational Saving	Provision for future Proofing	Take Option Forward	Commentary
<b>Route Options</b>																		
Do Nothing Option	No Infrastructure works																NO	Does not meet the objective
Route A	Online route																NO	Disruption to A10 traffic, Interface with existing houses & services.
Route B	Bypass south side																NO	Interface with existing houses
Route C1	Bypass north isde																YES	Interfaces with private property located on Barrington road.
Route C2	Bypass north side																YES	Not designed to current design speed but within the desirable limit of
Route C3	Bypass north side																NO	Longer route, capital cost not feasible
Route C4	Bypass north side																YES	Shortest of all route, minimum land intake, shorter structure span.
<b>Structural Options at new level crossing</b>																		
Option 1	Simply supported, overbridge																YES	High volume of insitu concrete.
Option 2	Integral, overbridge																YES	Longer bridge span, minimum maintainance cost
Option 3	Semi-Integral, overbridge																YES	Less concrete, no excavation, easy to demolish, low maintainance
Option 4	Steel composite overbridge deck																NO	High maintenance and capital cost
Option 5	Box Jacking technique, Underpass																NO	Requires high level of precession and accuracy
Option 6	Cut & Cover, Underpass																NO	Risk of flooding during excavation due to high water table
<b>Structural Option - Pedestrains, Cyclist and Equestrians</b>																		
Option 7	Footbridge with ramps for Pedestrain																YES	Long ramp lengths, unsuitable for disable people.
Option 8	Footbridge with stairs and lift shaft																YES	Cost effective, minimum land acquisition.
Option 9	Footbridge with ramps for Pedestrains, Cyclist and Equestrains																YES	Non traffic route but could friegthen horses during train movement.
Option 10	Subway with ramps																NO	Expensive, possible flooding during construction & max land intake

# Agenda Item 9

**GREATER  
CAMBRIDGE  
PARTNERSHIP**

Growing and sharing prosperity

Delivering our City Deal

**Report to:** Greater Cambridge Partnership Executive Board

08 February 2018

**Lead officer:** Chris Tunstall – GCP Interim Transport Director

## **Recommendations from the Ely to Cambridge A10 Transport Study and proposed next steps**

### **1. Purpose**

- 1.1. Transport improvements along the A10 corridor north of Cambridge are a key part of the feasibility of planned housing and employment growth at Cambridge Northern Fringe, Cambridge Science Park, Ely and Waterbeach (collectively around 17,500 new homes and 9,400 new jobs between 2011 and 2031).
- 1.2. The Ely to Cambridge Transport Study has been funded principally by the Greater Cambridge Partnership to help inform priorities for future funding. The study has now reached the conclusion and its recommendations are coming before the Executive Board to be endorsed. The Executive Board is asked to comment on the Study's initial findings.

### **2. Recommendations**

The Executive Board is asked to:

- a) Endorse the recommendations set out in the study;
- b) Commend the multi-modal package of measures to the Cambridgeshire and Peterborough Combined Authority for approval and further development.

### **3. Officer comment on technical issues raised at Joint Assembly**

- 3.1 The Joint Assembly Members discussed the balance between road and rail capacity and asked what more could be done to make use of rail before resorting to providing additional highway capacity.
- 3.2 It was explained that the recommendations from the study are clear that additional highway capacity is needed to cater for a significant proportion of strategic traffic. However, it is also clear that very significant public transport service enhancements and infrastructure, new pedestrian and cycle networks, and active parking restraint should be delivered alongside development in the study area and wider highways interventions. Increases in rail capacity are already being delivered, with trains between Kings Lynn and Cambridge increasing from four to eight cars and frequency on the same section increasing from hourly to half hourly in the next eighteen months. This will include for the first time stops at both Waterbeach and Cambridge North stations. The recommendations from the study help to maximise this extra capacity through relocating the existing station to better serve both the existing village and the new development. The relocation would also bring safety and capacity benefits for the rail network, and reduce congestion on village roads in the area of the current station.

- 3.3 The Assembly also raised a number of more detailed design questions relating to the alignment of a dualled A10 and also the location of a new Park and Ride site. The modelling did not test a specific alignment for the scheme, rather it just tested the principle of additional capacity, broadly on the alignment of the existing road. It is acknowledged that there are sections which would of necessity need to be offline, and costs for these will be developed in greater detail at the appropriate point in the design process.
- 3.4 It was explained that regarding the location of the Park and Ride site, again the modelling did not assume an exact location, but the function of the facility would be to intercept Cambridge-bound traffic as far north on the A10 as practical, enabling people to transfer to a segregated public transport corridor as seamlessly and quickly as possible. To do this, the site needs to be located as closely as possibly to the A10 however its exact location will be determined through the master planning process.
- 3.5. Questions were also raised regarding the next steps, particularly how the various options were to be developed going forward. There was a strong desire from the Joint Assembly that, whilst it was acknowledged that the Mayor and the Combined Authority would wish to pursue the road options (options 2-6), they felt GCP was in a good position to develop option 1, and could make that offer to the Combined Authority.

#### **4. Key issues and considerations**

##### ***Background***

- 4.1. The Ely to Cambridge Transport Study is a wide-ranging multi modal study which has made recommendations on the transport schemes needed to accommodate the major development planned at a new town north of Waterbeach, Cambridge Northern Fringe East (CNFE) and the Cambridge Science Park (CSP). The study has three strands:
- Strand 1 looks at the overall transport requirements on the corridor
  - Strand 2 looks at the specific requirements for growth at Waterbeach
  - Strand 3 looks at the specific requirements for growth at CNFE/CSP
- 4.2. The commission has delivered:
- An options study and Strategic Outline Business Case for the overall package of interventions on the Ely to Cambridge corridor. The Preliminary Strategic Outline Business Case is appended to this report in **Appendix 1**.
  - A transport study supported by modelling that identifies the infrastructure package and phasing of that package to provide for the transport demand of the development of a new town north of Waterbeach.
  - A transport study supported by modelling which provides evidence for the level of development which could be supported in the CNFE/CSP area and its phasing, in transport terms.
- 4.3. The scope of the study was drawn up to incorporate three separate, but interlinked issues; namely the need for a Strategic Planning Document or Area Action Plan for both Waterbeach New Town and the CNFE, hence providing a Transport Evidence Base for Plan Making as required by National Planning Practice Guidance. Early thinking was also required on the requirements of the whole corridor to inform future delivery of delivering the Greater Cambridge 'City Deal'.

### ***Technical work***

- 4.4. Strategic modelling using Cambridgeshire County Council's Cambridge Sub Region model (CSRM2) forms an intrinsic part of the technical work and has taken place in two phases. The first phase tested the effect of development at land north of Waterbeach and new development at CNFE/CSP on the transport network with no mitigation measures except for the most basic enabling measures, such as site access. This phase of the modelling provided a 'red flag' for areas on the highway network that were of concern and where mitigation measures needed to be considered. It also provided a baseline against which the effect of various mitigation measures could be tested.
- 4.5. The second phase of modelling tested potential mitigation measures. As a starting point, schemes which were already broadly identified in policies set out in the Long Term Transport Strategy and the Transport Strategy for Cambridge and South Cambridgeshire were included, however this was not a constraint.
- 4.6. A series of mitigation packages were tested, starting with a public transport/active modes package which was then built upon with various levels of highway capacity. The six tests are explained in more detail in section 5.

### ***Key issues from the technical work that have informed the study recommendations***

- 4.7. The results from the first phase of modelling highlighted that unsurprisingly, the Milton interchange has an important influence on how traffic behaves on the A10. When all the development was included and based on other assumptions within the model, the results suggest that the following route choices and movements are likely:
  - Between the Milton interchange and Waterbeach, traffic flows on the A10 remain relatively stable, confirming that this stretch of the road is already operating at capacity and is unable to carry significantly more traffic.
  - From Waterbeach village, and locations further north on the A10, from where people do have a route choice, flows on less appropriate routes south increase, for example through Clayhithe and Horningsea to the east, through Landbeach to the west, and along the B1049 Wilburton-Cottenham-Histon route, as traffic re-routes to avoid the congested A10.
  - From the new development north of Waterbeach where motorists don't have a route choice to travel south, vehicles are either joining the back of the queue on the A10, or turning right and heading north before turning west at Stretham then travelling south through Cottenham.
  - From Ely, traffic flows on alternative routes along the A142 west towards Sutton and east towards Newmarket increase, suggesting that some motorists try to avoid the A10 corridor altogether.
- 4.8. Further analysis of demand along the route was undertaken to help understand the type of trips that the A10 is used for. This has shown that without the significant development at the new town north of Waterbeach and at the CNFE and CSP, some 79% of trips on the A10 start or finish outside the study area, highlighting the strategic nature of the corridor. Even once these developments are included – which should encourage more local trip-making - this figure remains at about two-thirds. This has an implication for the ability to encourage a shift from car to non-car modes and consequently what proportion of trips might be able to be catered for by non-highway measures.
- 4.9. To the south of the study area at Cambridge Northern Fringe East and Cambridge Science Park, the modelling work suggests that to unlock further development on these sites a policy of radical parking restraint will be fundamental to making the sites work in transport terms.

- 4.10. Whilst a package of non-highway measures is necessary in policy terms and has some effect on mitigating the impacts of development, because of the strategic nature of trips on the A10 the modelling work suggests that this does not go far enough and as such, significant investment in highway capacity will also be required.

## 5. Options

### 5.1. Options modelled for mitigation

As indicated in section 4.6, six mitigation packages were modelled. Table 1 sets out what these packages were.

- 5.2. A separate study has been commissioned by the Combined Authority to consider whether there is a business case for extending the M11 northwards to connect with the A47. Whilst the full route is outside the scope of this study, option 6 has been included as a sensitivity test to investigate the principle of an offline link which could give strategic traffic an alternative to the A10, thus freeing up capacity on the route between Ely and Cambridge. Such a link could potentially form the southern section of a longer M11-A47 link. Due to the geographical limitations of the model, it has not been tested in the same way as the previous five options, however a commentary on the performance of this option is given in section 5.8.

**Table 1: Mitigation packages**

Option	Composition of package
Option 1 Mode-shift	Significant investment in cycling/pedestrian routes Segregated public transport route between development north of Waterbeach and Cambridge Bus-based P&R at development north of Waterbeach Relocated railway station Parking restraint at CNFE/CSP
Option 2 Junction improvements	Option 1 PLUS Improvements to eight junctions along the A10, including Milton Interchange
Option 3 North dual	Options 1 and 2 PLUS Dualling of A10 between Ely and development north of Waterbeach to encourage users to use new P&R site
Option 4 South dual	Options 1 and 2 PLUS Dualling of A10 between development north of Waterbeach and Milton Interchange to provide additional capacity on most congested section of route
Option 5 Full dual	Options 1, 2, 3 and 4 combined Dualling of length of A10 between Ely and Milton Interchange
Option 6 sensitivity test Offline alternative to A10	Options 1 and 2 PLUS New offline route to remove strategic traffic from the A10 and potentially form the southern section of an M11-A47 link

- 5.3. Initially, each of the options was analysed using the three key metrics from the model outputs: the effect on mode-share, the effect on traffic flow and delay, and the effect on journey time.

- 5.4. Considering mode-share, all options increase the number of trips on the corridor. The first two options reduce car mode share. However, once more substantial highway improvements are made, the car mode share starts to increase, at the expense of other modes, predominantly rail and active modes. This suggests that new car trips are being induced onto the route. Bus and Park & Ride mode share increase in all options, although little additional benefit is seen beyond Option 2 for the investment that would be required.

- 5.5. In terms of the effect each option has on flow and delay - compared to what would happen in a scenario without any mitigation measures - flows progressively increase on the A10 and A14 with each option. The increase on these two routes is accompanied in general by decreases in flows on parallel, less desirable routes suggesting that through traffic is being drawn back on to appropriate routes rather than rat-running through villages such as Horningsea, Clayhithe, Landbeach, Cottenham, Histon and Impington. However, in terms of delay, the more flow that starts to arrive in Ely as the options progress, the more delay that is introduced on certain junctions around the city. A full dual option also starts to present further delays at Milton Interchange.
- 5.6. Journey time has been measured along the A10, between the A10/A142 junction south of Ely and Chesterton Road in Cambridge. In the future scenario with no development at Waterbeach or CNFE/CSP and no mitigation measures, journey times southbound between these two points in the am peak are between 10 and 15 minutes more than in free flow conditions. In the future scenario with development at Waterbeach and CNFE/CSP, the journey time is between 15 and 20 minutes more than in free flow conditions. In the pm peak northbound, for the same two scenarios, the journey time is some 40 minutes greater than in free flow conditions with no development at Waterbeach and CNFE/CSP and around 50 minutes greater with development in these locations.
- 5.7. None of the options returns traffic flow to free-flow conditions in the morning or evening peaks, however each of the highway options progressively improves upon the end to end journey time in relation to the scenario without any mitigation measures. In the am peak, where the predominant flow is south-bound, only the south dual, or full dual options improve upon the journey times predicted for the future scenario without development and this improvement is less than five minutes. In the pm peak where the predominant flow is north bound, all the highway options improve upon the journey times for this same scenario and are slightly greater than the am peak, between 5 and 10 minutes.
- 5.8. The results from the offline option (Option 6) do seem to show the scheme has some merit, in that flows decrease on the A10 and most of the routes where rat running was seen in the first phase of modelling. This seems to confirm the analysis that a significant proportion of traffic currently using the A10 is strategic in nature and has an origin and/or destination outside the study area. Regarding journey times in the morning peak towards Cambridge, enough traffic appears to divert onto the alternative route to make journey times on the A10 comparable to the south dual option and better than options 1, 2 and 3, between the two points analysed. In the evening peak heading away from Cambridge however, the modelling suggests that journey times are better with the full dual and north dual options.

#### ***Study recommendations***

- 5.9. The study has confirmed the existing policy position that a multi-modal package of measures will be needed for the whole corridor. This will include a package of measures to encourage a mode shift away from car, including a high quality, segregated public transport route between Waterbeach and Cambridge, the relocation of Waterbeach station, significant investment in cycling and walking measures around the new development north of Waterbeach and a new Park and Ride facility.
- 5.10. Furthermore, whilst not being prescriptive about the level or type of development that is brought forward at CNFE or CSP, the study is clear that the transport characteristics of these significant sites will need to be very different to traditional housing, Science Park or office developments. These will be fundamentally driven by a policy of radical parking restraint.

- 5.11. The study also confirms that smaller scale highway measures to discourage rat running will be required along parallel routes, as well as improvements to junctions along the A10 in the short term. Finally, the study recommends that to accommodate the significant proportion of strategic trips through the study area, major investment in additional highway capacity along the A10 is made. In the medium term it recommends dualling the southern section, with a view to dualling the northern section in the longer term. This would take a broadly online alignment to the existing A10, although it is acknowledged that some sections would of necessity need to be offline.
- 5.12. The study suggests that the package as a whole, including a full dual of the A10 could cost upwards of £500 million, reflecting the level of investment that is considered necessary to accommodate the development aspirations in the area. This does not include a cost for the offline western option. Further work on each aspect of the recommendation will be required to progress any scheme through the next phases of feasibility, decision-making and delivery. Given the breadth of the recommendations and the level of investment required, a multi-agency approach is needed to progress the recommendations in a cohesive and joined up way.
- 5.13. The scheme assessment process requires assumptions to be made regarding the future years in which the costs will be incurred which for this study is assumed to be 2031. The software used in the assessment requires the use of a standard base year which at the present is 2010. This required the 2017 costs to be discounted to 2010. The Study costs are set out in Table 18 of the SOBC replicated below for clarity;

**Table 2: Application of Package Cost Discounts (£000s)**

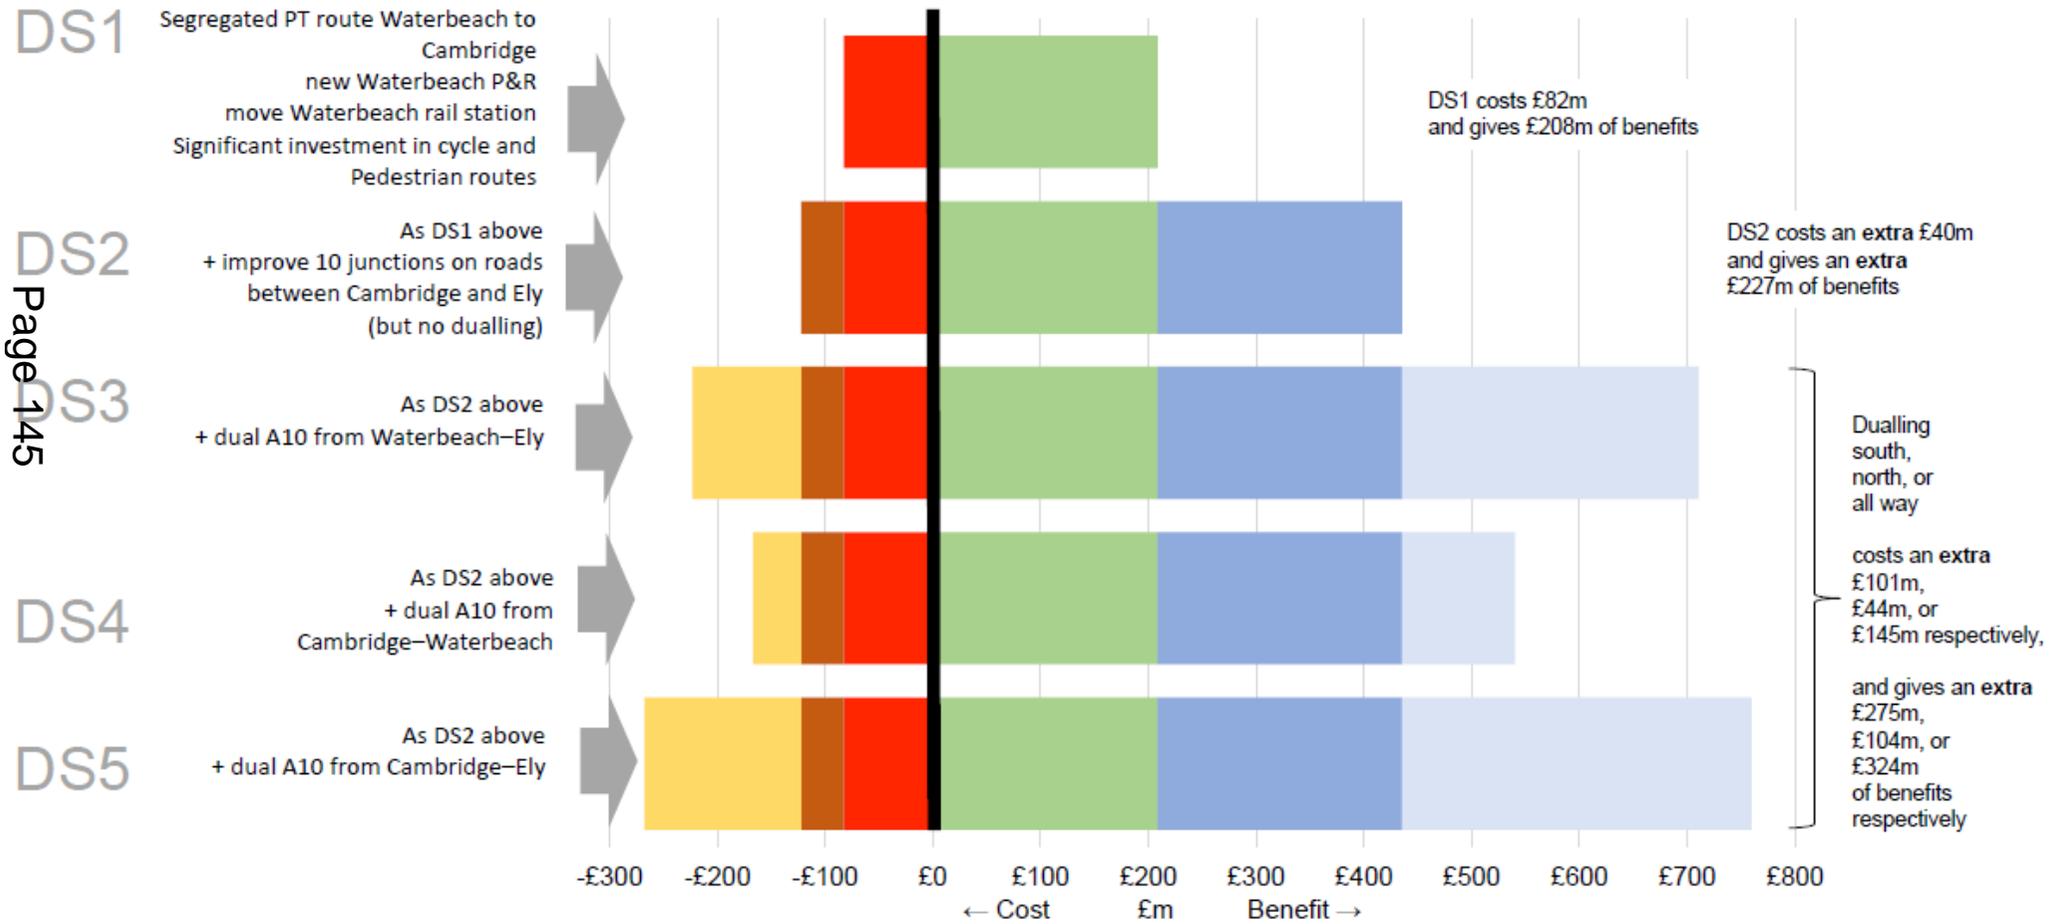

Cost Item	DS1 (Mode Shift)	DS2 (Junction Plus)	DS3 (North Dual)	DS4 (South Dual)	DS5 (Full Dual)
Package Estimate (2017 Prices)	151,700	224,500	414,900	306,400	508,600
Package Estimate (2010 Prices)	82,856	122,376,	222,947	166,856	267,482

- 5.14. The relative costs and benefits of the differing packages set out above can be seen in the graph below in figure 1.

Figure 1

# Comparison of the **costs** and **benefits** of the five options

(shown as present values of £m)

- 5.15. The study also recognises that an offline alignment that potentially forms the southern part of an M11-to A47 link has some merit by providing an alternative route for a significant proportion of strategic traffic that uses the A10. The Combined Authorities M11 to A47 study will consider this particular scheme further, however more work would need to be undertaken to establish whether there is a business case for both schemes.

## **6. Next steps and milestones**

### ***Progression of business case work***

- 6.1. Since the Ely-Cambridge Transport Study was commissioned, the political structure in Cambridgeshire has changed significantly with the formation of the Cambridgeshire and Peterborough Combined Authority. Whilst the Greater Cambridge Partnership has substantially funded the study, given the geographic coverage of the recommendations, it is considered appropriate that from this point forward the Combined Authority should have the responsibility for approving the recommendations and taking them forward for consultation. However, in terms of delivery, some elements of the package may be best delivered by other bodies, including the Greater Cambridge Partnership, Cambridgeshire County Council, the district councils or the private sector. GCP could then take forward those proposals identified in Option 1, specifically walking, cycling and public transport improvements. Specifically aligning the public transport improvements with the funding of the Cambridge Mass Rapid Transit Options Appraisal findings.
- 6.2. It is also suggested that the Executive Board support the proposal that the Combined Authority begins preparations to consult on the recommendations in summer 2018, once the purdah period has ended.
- 6.3. The recommendations from the study concludes the research phase of the work. In order to conclude the DfT's WebTag Stage 1 Option Development, there is a need for work to roll forward into the feasibility phase, which includes:
- Consulting on initial options set out in this study
  - Developing options in further detail
  - Further consultation on the detail of developed options
- 6.4. If the proposal to consult on the recommendations from the study in the summer of 2018 is approved, the results from this will then be used to inform and shape the development of options in more depth. It is suggested that alongside preparations for the consultation, joint consideration is given to which bodies might be best placed to deliver the various elements of the package, in order that the next phase of feasibility work can begin once the consultation is complete.

## **7. Implications**

### **7.1 Financial and other resources**

The study recommends a significant package of transport infrastructure costing upwards of £500m. Should the Combined Authority request that the Greater Cambridge Partnership progress the development and delivery of one or more elements of the package, further discussion between the two organisations will need to take place to establish who funds the scheme/s.

### **7.2. Legal**

All schemes taken forward will need to go through the appropriate statutory and legal processes as they are developed. **Page 146**

### 7.3. Staffing

Should the Combined Authority request that the Greater Cambridge Partnership progress the development of one or more elements of the package, given the scale of the schemes considerable demand could be placed on existing teams within the Partnership. Consideration will need to be given in due course to ensure they are resourced appropriately.

### 7.4. Risk management

A full project risk register forms part of the Project Plan.

### 7.5. Equality and diversity

The package of measures recommended in the study will help improve access to services, jobs and educational opportunities not only by car but also by public transport and active modes. A Community Impact Assessment will be carried out and reviewed as appropriate as each scheme develops.

### 7.6. Climate change and environmental

The study recommends significant early investment in active modes of transport such as cycling and walking between Ely, Waterbeach and Cambridge, as well as neighbouring villages. Furthermore, it also recommends early investment in public transport measures such as a segregated public transport corridor between Waterbeach and Cambridge, a new Park and Ride site and the relocation of Waterbeach Railway Station. The recommendations from the study therefore have positive implications for climate change by making available alternatives to the private car for making journeys. Environmental surveys will be undertaken on all schemes at the appropriate time to ensure that any adverse impacts are properly mitigated.

### 7.7. Consultation and communication

As the study has progressed, engagement with key stakeholders has been undertaken. Partner authorities have been part of both the Project Team and Project Board. The Boards of both the Greater Cambridge Partnership and the Cambridgeshire and Peterborough Combined Authority have been briefed and a local member briefing was undertaken on 8<sup>th</sup> January. As set out in paragraphs 6.2 and 6.4, a wider public consultation exercise is recommended in the summer of 2018 on the recommendations from the study. Whilst the Combined Authority will need to lead on this, given the breadth of the recommendations, the consultation will need to be extensive. A joined up approach will be desirable and the GCP will need to support this.

# Executive summary

## The role of the Ely to Cambridge area in the Cambridgeshire economy

This report sets out the findings of a transport study into the transport network linking Ely and Fenland to Cambridge and the strategic transport network in the county of Cambridgeshire.

The A10 Primary Route and the parallel Cambridge to Kings Lynn railway line are the main transport links between Ely and Cambridge. They provide for travel between Fenland, East Cambridgeshire, West Norfolk and Cambridge, and directly serve a number of key centres of economic activity on the northern fringe of Cambridge and on the routes themselves.

The Cambridge Science Park and neighbouring innovation centres and business parks on the northern fringe of Cambridge are home to an exceptionally high-performing cluster of high-tech and knowledge-based businesses which have benefited from close associations with the University of Cambridge and generate Gross Value Added well in excess of national and county averages.

## Capacity constraints threaten further growth

Because of their position linking these employment sites to residential areas in Ely and beyond, the road and rail links in the study area are already very busy, particularly at peak times, when there is extensive congestion. There is limited capacity to accommodate further travel demand on this key corridor, which will impede further economic and housing growth if not addressed.

To support the continued success and growth of the high tech and knowledge-based cluster, more employment floorspace close to the existing sites is needed, as is affordable housing for those working in these businesses. The lack of employment space and affordable housing constrain further growth of the cluster.

Employment constraints reflect the natural growth of existing businesses occupying additional space allocated in designated science and business parks. Meanwhile the housing constraint reflects both national trends towards increasing housing costs and also the relative affluence of those working in these businesses, which (in the context of limited supply) has pushed house prices in and around Cambridge to very high levels.

## The need to address these constraints

Given local and national policies supporting further growth of the Cambridge area's strongly performing economy, there is a pressing need to address these constraints.

Accordingly, local planning policy is supportive of a programme of significant development of both employment land and residential land, focused on the southern end of the Ely to Cambridge study area where the main existing economic activity is located, and extending northwards to Ely, taking advantage of the availability of relatively large tracts of brownfield and undeveloped land.

The key sites for this development are at a new town north of Waterbeach, at the Cambridge Science Park, on the Cambridge Northern Fringe East and at sites around Ely. Between them, these developments could bring up to 17,000 new homes and 14,000 new jobs.

Without further investment to manage and accommodate new travel demand, the increased volume of travel which arises from these developments will exacerbate congestion and crowding problems which are apparent today, and will displace traffic onto less suitable parallel routes.

There is therefore a need to develop and deliver a package of transport measures both to address the problems experienced today and to manage the impacts of growth.

### Objectives to inform option development and assessment

A series of objectives have been agreed, distilling the key challenges and opportunities identified through this transport study. They also reflect:

- the high-level policy requirements set out in the Transport Strategy for Cambridge and South Cambridgeshire, the Third Cambridge Local Transport Plan, and the Cambridgeshire Long Term Transport Strategy, and
- the detailed policy position set out in the Cambridge and South Cambridgeshire Local Plans and the transport strategies in relation to the new town north of Waterbeach and developments on the Cambridge Northern Fringe.

The objectives seek to:

1. Maintain traffic at or below 2011 traffic levels in Cambridge
2. Minimise vehicle mileage whilst providing for increased travel demand
3. Improve reliability, capacity and speed of alternative transport modes
4. Minimise potential impact on alternative "rat-runs" to the A10
5. Intercept or substitute car trips with alternative transport modes
6. Address transport demand from the new town north of Waterbeach
7. Enable development in the Cambridge North Fringe East/Cambridge Science Park to proceed

### Developing options for assessment

This study has assessed options to reduce highway travel demand and options which assist in accommodating increased travel demand as sustainably as possible. A key finding is that the level and management of parking space at the development sites will be critical, and parking standards for key employment sites will need to be reviewed.

In conjunction, this study has assessed progressively greater levels of transport investment – initially testing in isolation measures aimed at encouraging a shift from car use to public transport, walking, and cycling, and subsequently testing these in conjunction first with junction improvements along the A10, and finally with the implementation of dual carriageway standards on the South, North, and full A10 corridor between Ely and Cambridge.

The packages of transport measures that were developed for assessment are:

- **Mode-shift (DS1) – indicative cost, £150 million**  
Minimal highway network improvements providing only for direct access to the development sites, and measures to encourage mode shift to non-car modes of transport, including:
  - a relocated Waterbeach railway station serving both the village and the new town,
  - segregated public transport links between the new town at Waterbeach and Cambridge, and park and ride capacity at the new town to intercept trips into the city,

- a comprehensive pedestrian and cycle network serving the new town and linking it to Cambridge and neighbouring villages, and
- Parking restraints and travel planning measures at all of the major development sites.
- **Junction+ (DS2) – indicative cost, £225 million**  
Mode-shift option measures from DS1, and additionally, improvements to provide additional capacity at junctions on the A10 between Ely and Cambridge.
- **North-dual (DS3) – indicative cost, £415 million**  
Mode-shift and Junction+ measures from DS1 and DS2, and additionally, the provision of a dual carriageway route, on an alignment to be determined, between the new town north of Waterbeach and Ely
- **South-dual (DS4) – indicative cost, £310 million**  
Mode-shift and Junction+ measures from DS1 and DS2, and additionally, the provision of a dual carriageway route, on an alignment to be determined, between the new town north of Waterbeach and the A14 at the Milton Interchange.
- **Full-dual (DS5) – indicative cost, £510 million**  
Mode-shift and Junction+ measures from DS1 and DS2, and additionally, the provision of a dual carriageway route, on an alignment to be determined, between Ely and the A14 at the Milton Interchange.

A key finding is that while the mode-shift options without highway improvements provide additional travel capacity and have significant benefits, they do not substantially address the congestion and traffic displacement issues identified. Options with highway improvements are more effective in addressing these issues.

## Costs and Benefits

Options involving substantial highway improvement and capacity enhancement works entail higher capital costs; fully upgrading the A10 between Ely and Cambridge to dual carriageway standard has the highest capital cost of all interventions that have been assessed.

However, those same options also deliver greater levels of benefit, and all packages assessed generate sufficient benefits to more than outweigh the estimated cost of implementation, and are assessed as providing 'high value for money'.

The best value for money was derived from the mode shift and Junction + option (DS2), which generated a benefit to cost ratio (BCR) of 3.6 to 1. The next best value for money was the upgrading of the southern stretch of the A10 from Waterbeach to Cambridge to dual carriageway, together with mode shift measures, which delivered a BCR of 3.2 to 1. The greatest level of benefit was generated by the full upgrading of the A10 from Ely to Cambridge, which generated benefits at present value of some £760m over the lifetime of the scheme, at a BCR of 2.8 to 1.

The costs noted for the tested packages are indicative, and at this stage of the business case process, are not based on specific scheme designs. More refined scheme costs would emerge as part of further scheme development. Similarly, the assessment of benefits would also be refined, and would bring in consideration of wider economic benefits.

## Commercial and Management cases

At this stage in the development of measures to support the growth in the study area, it is sufficient to note that there are a variety of routes through which the eventual scheme(s) could and would be procured, and that Cambridgeshire County Council has experience of successfully delivering substantial infrastructure schemes and has robust governance in place for such undertakings.

## Conclusions

A joined-up strategy is required that seeks to introduce both demand and supply-side measures in and around the study area to cater towards all modes of transport and ensure that potential issues are mitigated. Mechanisms should be put in place to secure developer funding to deliver, or substantially contribute towards the strategy, thus ensuring that adverse transport impacts are mitigated. The recommended strategy has been divided into three stages;

### 1. Policy, Planning and Regulation

A demand management approach should be adopted for development and applied to planning applications for proposals in, and impacting, the corridor, whereby development should:

- Minimise external vehicular trip generation through maximising trip internalisation
- Provide significantly lower levels of car parking than has traditionally been provided, particularly at employment locations
- Promote a site-wide approach to car parking management to reduce the need for significant increases in car parking provision
- Promote the use of non-car modes through appropriate investment in supply-side measures and aggressive travel planning to encourage the required mode shift

Acceptable and stretching highway ‘trip budgets’ should be identified for each site and permission for continued stages of development should be made contingent on the ability of the developers to demonstrate their sites are meeting these targets through effective promotion of non-car-mode take-up and site-based demand management. Developers might be able to accelerate the phasing of their sites should they be able to demonstrate that their sites are hitting targets for car trips and are not exceeding an agreed budget. This would encourage effective promotion of non-car-mode take-up to free up “headroom” for further development.

### 2. Delivery of multi-modal “quick wins”

The recommended strategy requires sequential delivery of “quick wins” – comprising public transport, pedestrian and cycle enhancements and active parking restraint to promote mode shift away from the private car, and a series of prioritised on- and off-line localised highway improvements to create capacity for additional trips and manage potential re-assignment of trips onto less suitable routes.

The recommended non-private car strategy is for:

- early implementation of the cycle measures,
- a relocated railway station at Waterbeach and
- early progression of the segregated public transport corridor from Waterbeach to Cambridge’s Northern Fringe, together with park and ride provision at the new town.

Implementation of the non-highway proposals alongside ambitious travel planning for new and existing communities in the corridor could create some headroom for early, moderate scale,

development at Waterbeach and at Cambridge Northern Fringe East and the Cambridge Science Park.

Options for junction improvements and other localised highway capacity improvements should be developed for early implementation. Targeted improvements at junctions along the A10 itself will lead to some improvements in conditions and reduce traffic rerouting elsewhere. These improvements should be accompanied by measures to discourage use of less suitable parallel routes including the B1049 and B1047.

### **3. Longer-term major highway interventions**

Model-based analysis shows that the above “quick wins” alone will not mitigate more significant development-related growth, nor substantially address existing or future congestion.

Beyond the investments noted above, this study indicates that there could be significant additional transport benefits from providing increased carriageway capacity in the Ely to Cambridge corridor, and that this will be required to mitigate both longer-term background growth in travel demand and more significant proposals for development, particularly at the new town north of Waterbeach.

The initial study work suggests that, subject to more detailed work including examining environmental and operational impacts further, provision of increased carriageway capacity would represent a high value for money investment. This provision might be in the corridor itself, or on an alternative corridor if such an alignment were shown to remove a significant proportion of longer distance/through-traffic from the A10, or potentially through improvements to both.

### **Next steps**

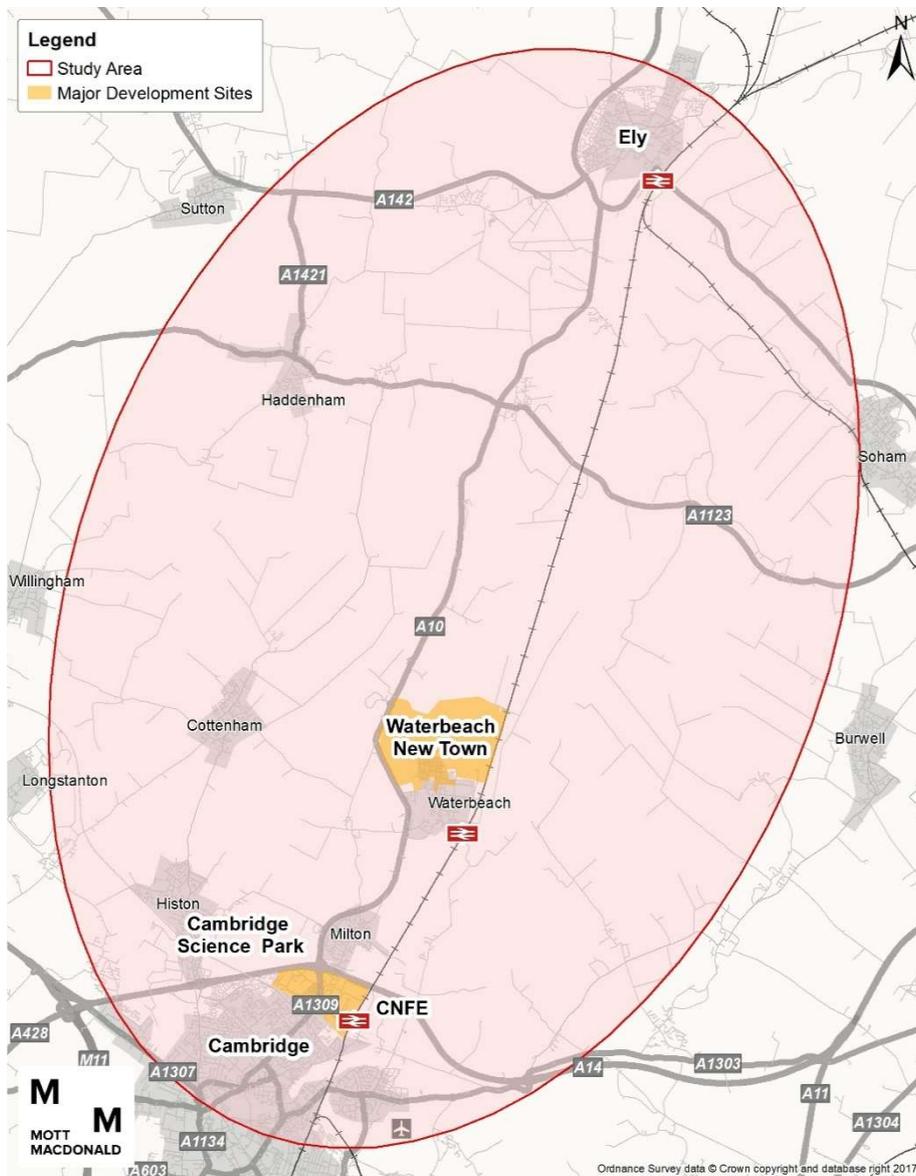

Further work will be needed to develop the case and options for intervention to support growth in the A10 corridor, and it is recommended that detailed follow-on studies are undertaken for the key elements of each package to refine the options and develop business cases for those investments. Thought will also be needed as to how to secure appropriate contributions from developers towards these strategic interventions.

# 1 Introduction

## 1.1 Headline Description

The Ely to Cambridge study area comprises the A10, a key north-south link in the Cambridgeshire highway network, and the parallel Cambridge to Kings Lynn railway line. The A10 is part of the Primary Route Network with the section in the study area being of single carriageway standard, linking the A14 Milton Interchange in the south to the A142 roundabout to the north at Ely. It passes adjacent to the villages of Milton, Landbeach, Waterbeach and Stretham. The study area is illustrated in Figure 1.

**Figure 1: Indicative Ely to Cambridge Transport Study Area**

Source: Mott MacDonald/OS

Currently, the route is subject to queueing and delays in peak times. These issues will be compounded in future years with further population, employment and traffic growth, and via development proposals at locations including Ely, at Waterbeach and on Cambridge's Northern Fringe.

The corridor is a focus for growth with strategic sites and other development anticipated in the study area up to 2031 and beyond. The Transport Strategy for Cambridge and South Cambridge (TSCSC) identifies a number of potential transport interventions in this corridor across the two districts which will provide for the transport demand associated with high levels of employment and population growth.

This Preliminary Strategic Outline Business Case (SOBC) sets out the case for interventions to address problems in the Ely to Cambridge study area. It represents the first stage of scheme appraisal and development, and as such will focus on establishing what the best transport strategy for the corridor will be, based on the assessment of differing levels of intervention.

## 1.2 Scheme Background

Mott MacDonald has been commissioned by Cambridgeshire County Council (CCC) on behalf of the Greater Cambridge Partnership to deliver the Ely to Cambridge Transport Study.

This important rail and primary route highway corridor provides one of the main links between Cambridge, its north eastern sub-region, including Ely, and beyond. It is also the focus of significant planned future development, with the Waterbeach New Settlement and the Cambridge Northern Fringe East (CNFE) and Cambridge Science Park (CSP) sites being the potential future location for significant residential and employment development. These key elements are shown in the indicative study area plan above.

As specified in the study brief, the outputs of the study are:

- An Options Study and Strategic Outline Business Case for the overall package of interventions between Ely and Cambridge, including development of principles/mechanisms for securing appropriate developer contributions.
- A Transport Study, supported by modelling, that identifies the infrastructure package and phasing of that package to provide for the transport demand of the development of a new town north of Waterbeach.
- A Transport Study, supported by modelling, which provides evidence for the level of development which could be supported in the CNFE and CSP areas and their phasing, in transport terms.

This report comprises the first output of the study listed above.

## 1.3 Report Structure

This report has been aligned with DfT's 'The Transport Business Cases' guidance, which sets out the 5-case structure for demonstrating the viability of transport proposals. These include:

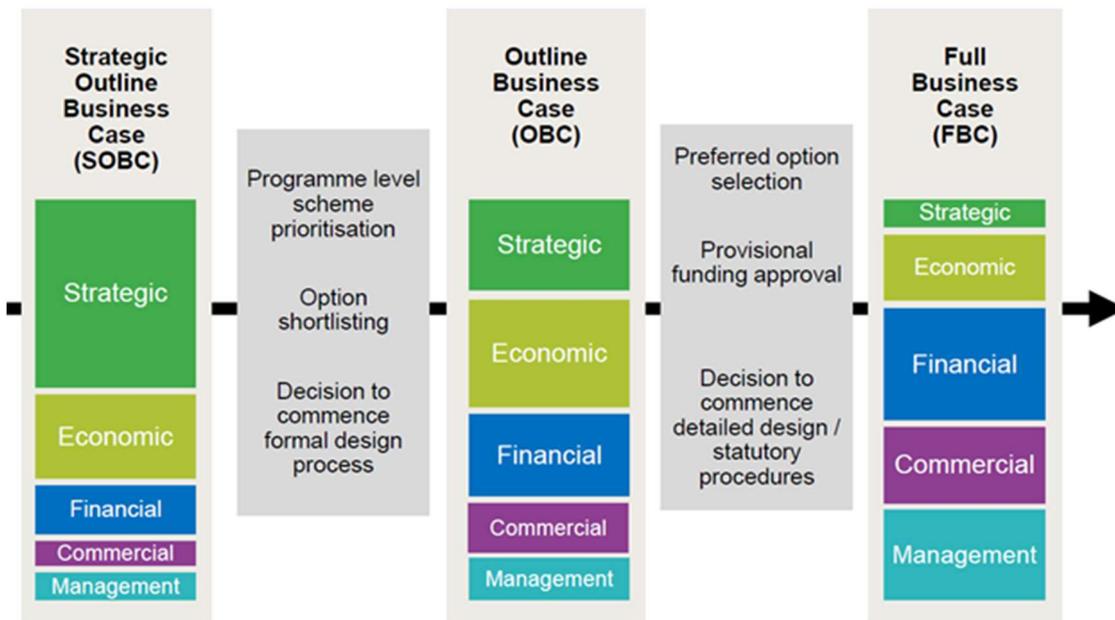

- Strategic Case
- Economic Case
- Financial Case
- Commercial Case
- Management Case

As the projects evolve, each of the cases is developed in further iterations of the Business Case documentation. These are:

- Strategic Outline Business Case (SOBC): Outlines the need for intervention in the context of established policy and current/future network issues. Undertakes a high-level appraisal of options that address locally developed objectives and a high-level strategy for delivering the interventions.
- Outline Business Case (OBC): Updates and builds upon the evidence base developed in the SOBC to incorporate a more detailed appraisal of intervention options focusing on estimating the likely performance and impact of intervention(s) in sufficient detail.
- Full Business Case (FBC): A further update of the OBC which considers the deliverability and management of the preferred intervention into the construction phases.

The relative level of input required at each phase is illustrated in Figure 2.

**Figure 2: Summary of Business Case Development**

This report acts as a precursor to full SOBC reports that will be required for individual schemes and measures and consequently is titled a Preliminary SOBC. The purpose of producing a report at this stage is to identify appropriate transport packages that can be implemented on the Ely to Cambridge Corridor. It is recognised that early option development forms a key part of the business case process and therefore a preliminary appraisal of five transport packages has been undertaken in this report to inform the ongoing development and delivery of a transport strategy for the Ely to Cambridge study area.

The contents of this report, alongside a summary of each part of the report is set out below in Table 1.

**Table 1: SOBC Contents**

<b>Business Case Element</b>	<b>Report Sections</b>	<b>Description</b>
<b>Introductions</b>	Section 1	Introduction to report structure and study area
<b>Strategic Case</b>	Section 2	Definition of the need for intervention and summary of option appraisal, based on evidence from policy, socio-economics and transport modelling
<b>Financial Case</b>	Section 3	Quantification of financial requirements for delivering the interventions
<b>Economic Case</b>	Section 4	Quantification of the benefits of interventions to counterbalance the cost of investment
<b>Commercial Case</b>	Section 5	Description of potential procurement and contractual arrangements required to deliver interventions
<b>Management Case</b>	Section 6	Outline of potential governance structures and project processes/interfaces required to deliver interventions.
<b>Summary and Conclusions</b>	Section 7	Outline of key findings and next steps

Source: Mott MacDonald

## 2 Strategic Case

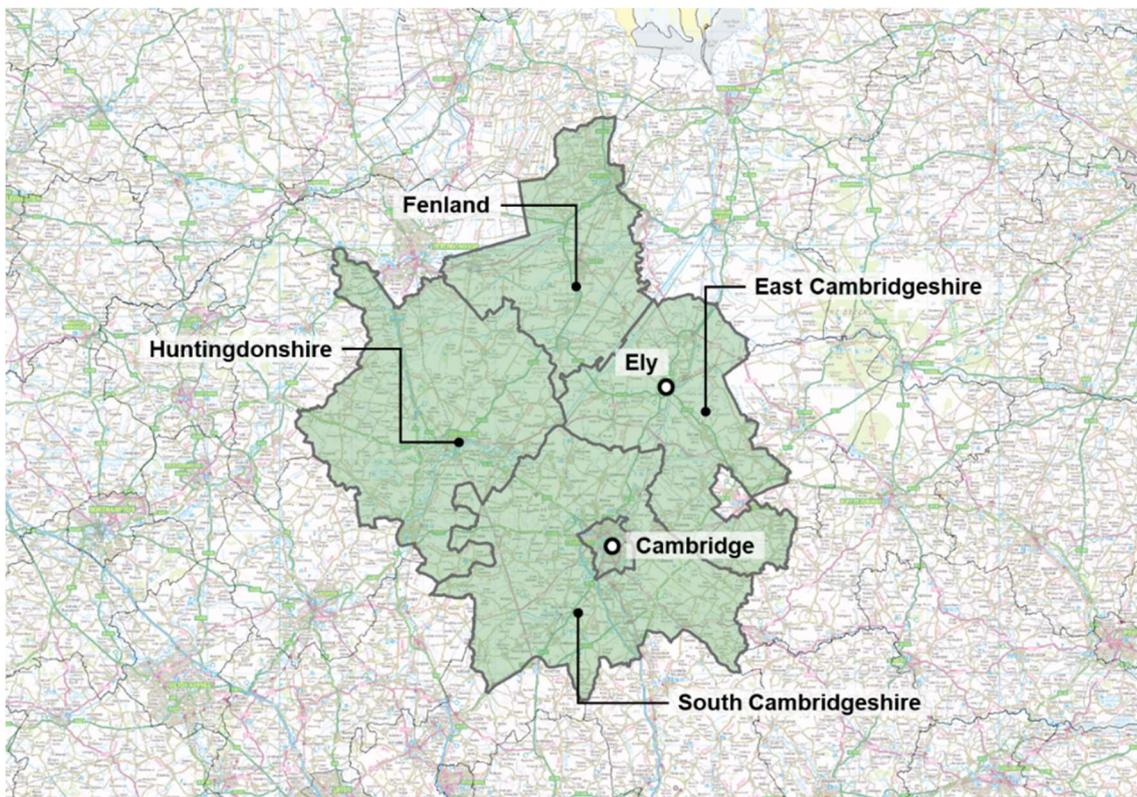

The purpose of the Strategic Case is to provide a wider narrative of the issues and opportunities in the study area that demonstrate a need for intervention. It then identifies five potential packages of interventions that could be adopted, and highlights the key findings from traffic modelling undertaken for each option. This section is based on a more detailed analysis and identification of problems and opportunities on the corridor included in an accompanying Evidence Base Report.

### 2.1 Economy and Population

#### The City of Cambridge: the engine of the Cambridgeshire economy

Together, the five districts of Cambridgeshire are home to a population of some 650,000 (647,000 in 2015). Nearly a quarter of these live in the Cambridge area in the south of the county. The boundaries of the county's districts are highlighted in Figure 3 below.

**Figure 3: Cambridgeshire Authority Boundaries**

Source: Ordnance Survey

Cambridge is both the geographical and the functional heart one of the UK's most economically important areas, and also serves as the county's administrative centre. It is the site of the world-leading University of Cambridge and Anglia Ruskin University, and possesses a thriving knowledge economy. As well as being a major employer in its own right, the university sector generates associated business activity of exceptionally high value through spin-off technology

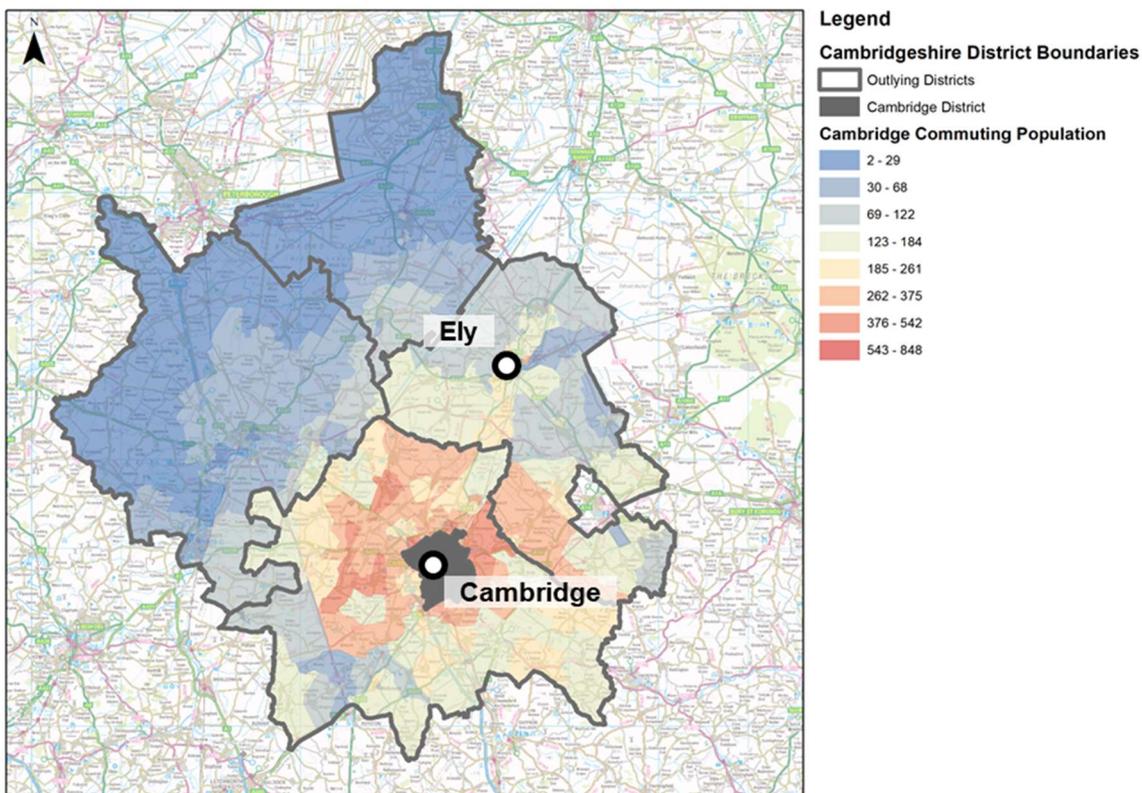

enterprises located at the science and business parks located to the north of the city and in South Cambridgeshire, at the Cambridge Biomedical Campus to the south of the city, and at other locations in the sub-region.

These digital and life science businesses make Cambridge a major centre for employment in the technology sector across the UK, and indeed across Europe, with major businesses such as Acorn Computers (and the related microprocessor designer ARM), Solexa, Raspberry Pi, and Darktrace having emerged there since the late 1970s, and global tech companies such as Amazon and Apple establishing a presence in the city. Beyond science and technology, Cambridge has a strong business and management sector which has grown up around the universities and the cluster businesses.

As a result of all this activity layered on top of the many jobs traditionally associated with the day-to-day functioning of a major urban centre, Cambridge is home to by far the largest share of the jobs in Cambridgeshire, with a ratio of 1.2 jobs to every working age resident<sup>1</sup> (a statistic which includes the resident student population, many of whom do not in fact participate actively in the labour market). Accordingly, many of those employed in and on the fringes of Cambridge live in surrounding areas and travel some distance to their places of work.

This pattern is clearly visible in Figure 4 below, which shows how large numbers of people from across South Cambridgeshire and parts of East Cambridgeshire (notably northwards along the Ely to Cambridge corridor) commute to the Cambridge.

**Figure 4: Population commuting to the Cambridge**

Source: Ordnance Survey/NOMIS

<sup>1</sup> NOMIS data

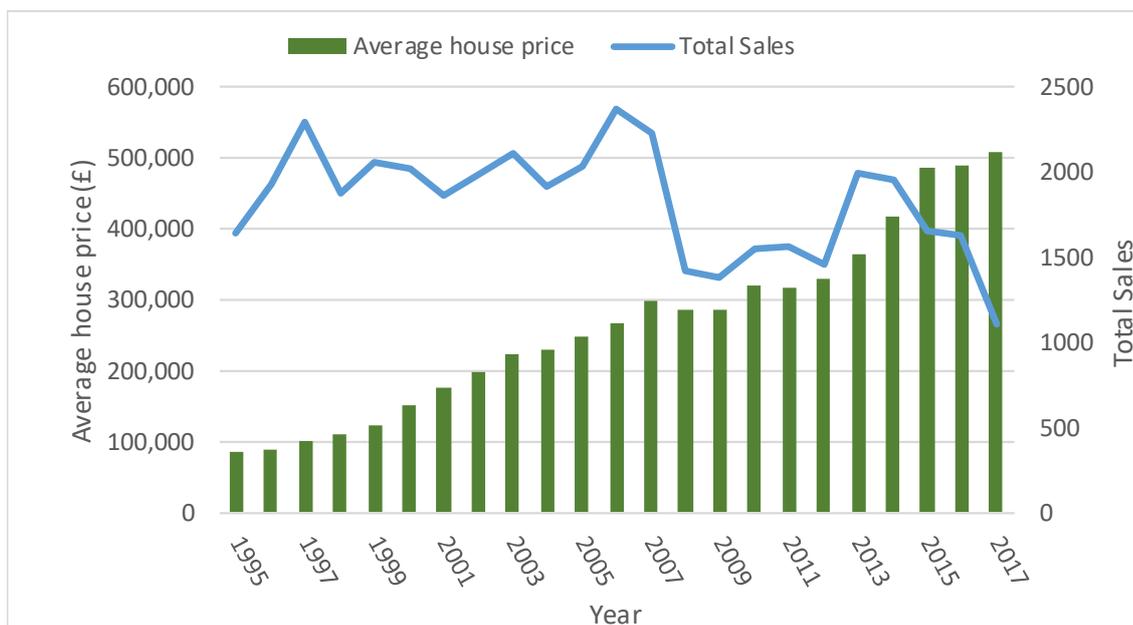

Beyond Cambridge, there is a ring of towns – St Neots, Huntingdon and St Ives in Huntingdonshire, Ely in East Cambridgeshire, Newmarket and Haverhill in Suffolk, and Royston in Hertfordshire, from which sizeable numbers of those living find employment in Cambridge. The same is true of the many smaller settlements across particularly the southern parts of Cambridgeshire.

### Escalating demand for housing and the City’s growing labour catchment

Over the last two decades, the strong economic performance of the Cambridge area has created many jobs of very high value (with GVA per head around £45,000 compared to between £22,000 and £28,000 across the rest of the county and around £25,000 across the UK as a whole). Consequently, it has attracted a large and affluent workforce. These successes have rightly been widely celebrated, but alongside its many positive impacts, growth has nonetheless contributed to a situation in which house prices have risen much faster than inflation over the past twenty or more years.

Figure 5 below illustrates an upward trend since 1995 which saw the average house price in Cambridge City climb from under £100,000 to some £500,000 in 2017, while the volume of sales fell over the same period. This is strong evidence of increasingly intense competition among a growing number of (increasingly affluent) would-be purchasers for what is effectively a fixed supply of housing, with those on lower income being priced out of the Cambridge housing market.

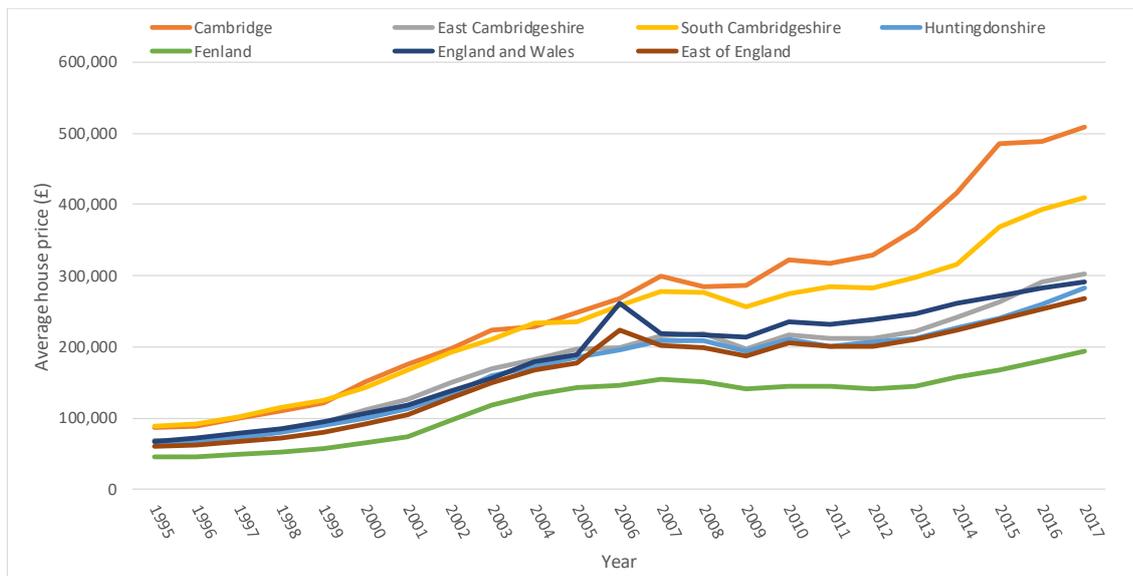

**Figure 5: House prices and sales in Cambridge City, 1995-2017**

Source: HM Land Registry

Figure 6 below makes clear that this is a particular problem in Cambridge and South Cambridgeshire; prices here have grown by between £300,000 and £400,000 since 1995, while prices in Fenland have risen by around £150,000.

**Figure 6: House prices by district, regions and nations, 1995-2017**

Source: HM Land Registry

The travel to work catchment for Cambridge has increased markedly, such that it is now not uncommon to commute to Cambridge from towns and villages around Norfolk, Suffolk, Hertfordshire, Essex, and even the north of London – while at the same time, the numbers of people commuting from the surrounding districts of Cambridgeshire which have always supplied the City with workers also continue to grow.

As the following section will make clear, the trend towards more and longer-distance commuting from within and beyond Cambridgeshire has led to increased pressure on the radial highway and public transport connections into Cambridge, leading to increases in journey times, reductions in journey time reliability, and increases in crowding.

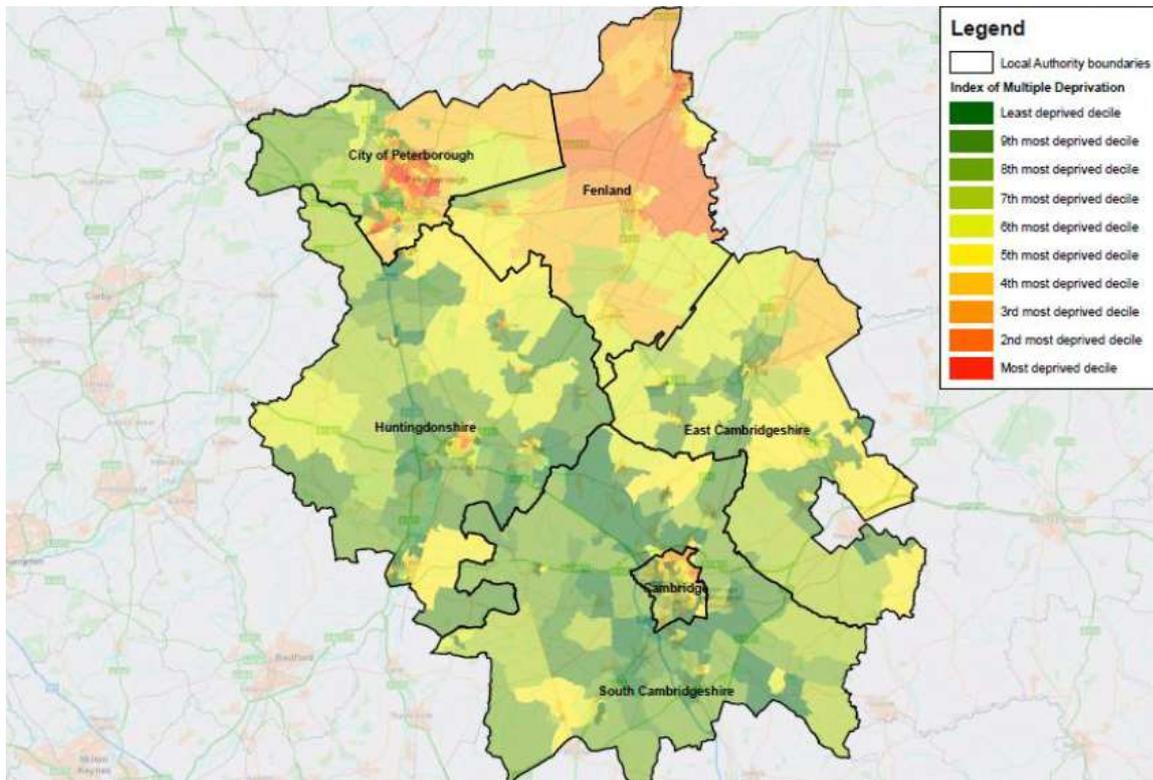

These issues not only lead to frustration and delay for those travelling in the affected areas, but at the extreme, an inability to efficiently deliver employees to their places of work may also threaten the county’s otherwise strong prospects for growth.

The availability of affordable housing has caused difficulty for employers to recruit suitably qualified employees who may be required both to commute long distances, and also to locate in parts of the county which offer fewer of the conveniences such as ready access to high quality public transport, which are on offer closer to the urban core of Cambridge City.

Ultimately, if the cost of suitable accommodation in areas with sufficient transport connections and amenities becomes prohibitive within the context of the wages that businesses in Cambridge and the surrounding areas of South Cambridgeshire are able to pay, then businesses may find themselves unable to recruit appropriately qualified staff.

A further issue is the wide disparities between life outcomes which are found across different parts of Cambridgeshire. Fenland and East Cambridge, for example, lag well behind the Cambridge city average for incomes, and have rates of multiple deprivation far in excess of those in most other parts of the county, as illustrated in Figure 7 . Local policy seeks to ensure that these areas are able to share in the success of the activity clustered in and around Cambridge.

**Figure 7: Indices of Multiple Deprivation across Cambridgeshire & Peterborough**

For all these reasons, the identification of suitable locations for development of both residential and employment space, coupled with an effective strategy for delivery of supporting infrastructure is a key objective of the emerging Local Plans. Significant levels of development are proposed in the study area, including the proposed new settlement north of Waterbeach, where there are opportunities to focus growth along with the necessary infrastructure. The Local Plans were prepared in parallel with the Transport Strategy for Cambridge and South Cambridgeshire, which established the transport interventions that would be necessary to support growth. This includes measures to provide access to developments by walking and cycling, public transport, and to address highway impacts.

Clearly however, to ensure that growth is not simply accommodated at the expense of problematic deteriorations in travel conditions, development will need to be carefully planned, and supported by an appropriate strategy for transport.

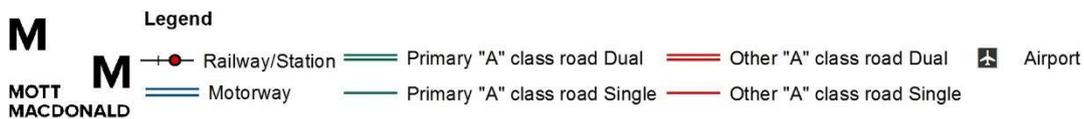

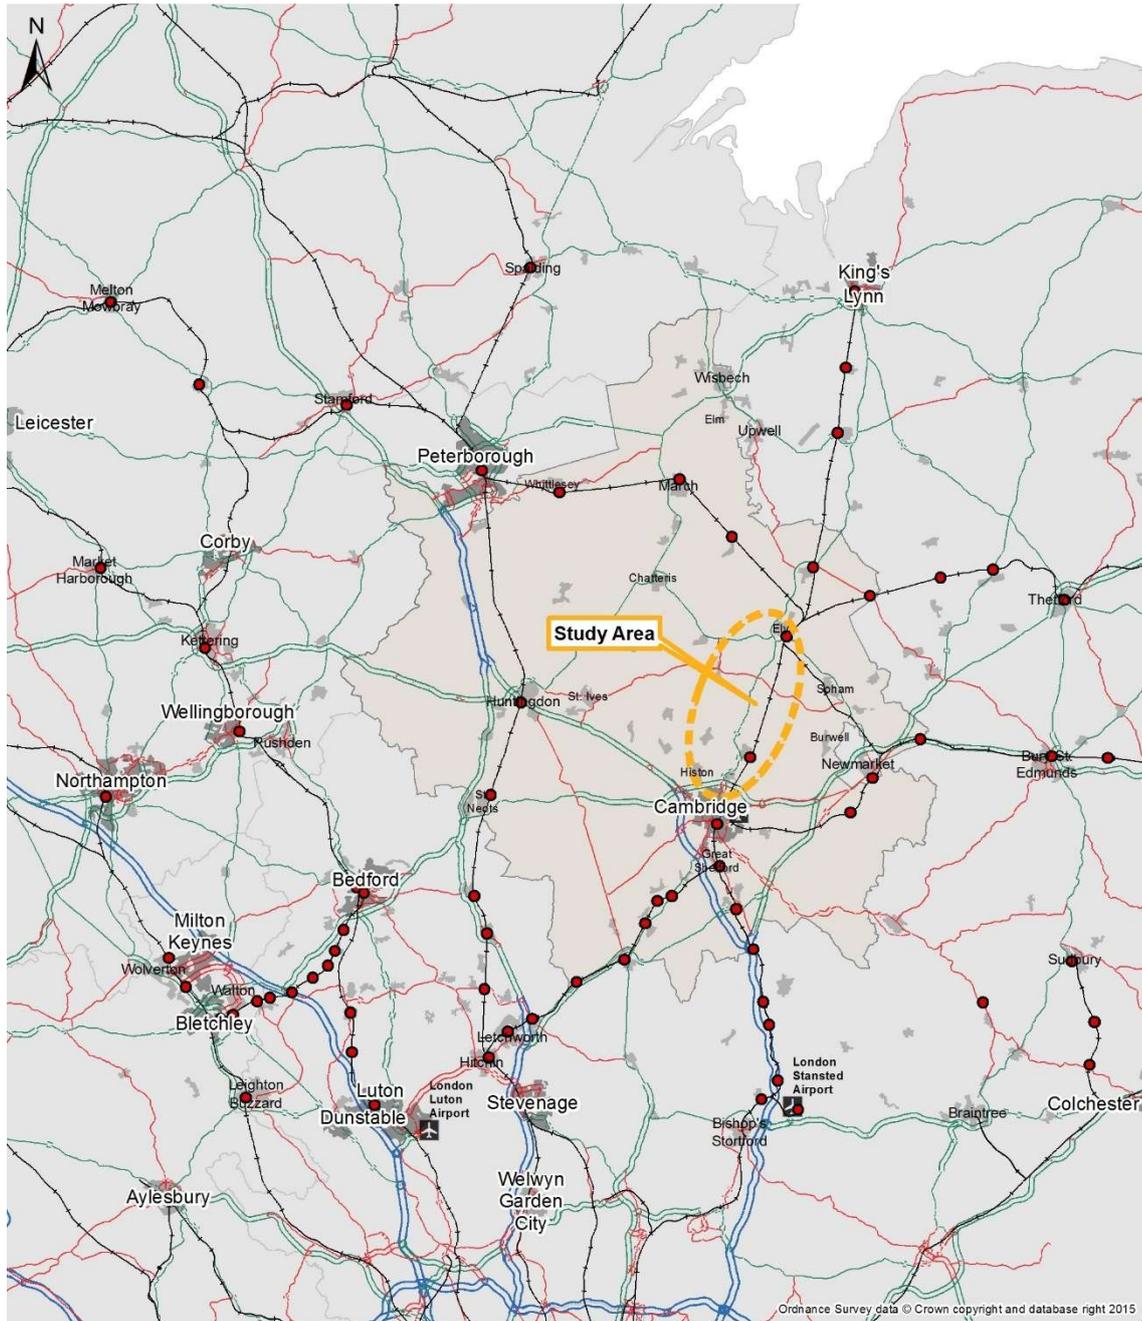

## 2.2 Transport

### Strong transport connections link Cambridge to the county beyond

In view of its role as the county's main area of economic activity, and the trend towards commuting from outlying areas, the transport connections between Cambridge and other towns and settlements within and beyond Cambridgeshire are clearly of very significant strategic importance to the effective functioning of the entire county.

These links ensure that key employment zones can be readily reached by those living in the county at large, as well as by those living within the city and its immediate surroundings. The map below highlights the railway, busway, and main road connections in the county.

**Figure 8: Cambridgeshire's strategic transport network**

Source: Ordnance Survey

As is apparent from the map in Figure 8, the county is relatively well served by fixed public transport infrastructure. Several routes converge at Cambridge station, which lies just to the south east of the city centre. These provide direct regional links to Peterborough, Kings Lynn, Norwich, Ipswich, Stevenage, Newmarket, Ely, March and Stansted Airport, as well as frequent

services to London Liverpool Street and London Kings Cross, and an hourly service to Birmingham. Cambridge railway station is the busiest in the East of England and was used by almost 11.5 million passengers in 2016/17.

Cambridge is further served by Cambridge North station, located approximately 3km to the north east of the city centre. This new station opened in May 2017 and serves travellers living nearby, as well as allowing access from across the county and beyond to employment opportunities at Cambridge Science Park, and the Cambridge Business Park, both of which are close at hand.

The Cambridgeshire Guided Busway (which also provides a connection to St Ives, the new town of Northstowe, and intervening villages) also calls at Cambridge North station, along with a number of local bus services. The station is well-placed for access by bike and on foot and includes parking for 1,000 cycles. The station also incorporates some 450 parking spaces, supporting park and ride journeys from across the surrounding area.

Ely Station, some 25km north of Cambridge, is a hub for trains running to destinations including Cambridge, Stansted Airport, London, Ipswich, Norwich, King's Lynn, Peterborough, Leicester, Birmingham, Nottingham, Sheffield, Manchester and Liverpool. It also provides interchange for a number of intermediate local stations.

Highway connectivity across the county is underpinned by a network of strategically important roads, many linking Cambridge City to important locations nearby – the M11 to Stansted Airport and London, the A14 to Huntingdon and Newmarket, the A10 to Ely and Royston and the A428 to St Neots.

The A10, M11 and the A14 to Newmarket all run broadly in parallel with a rail route. The A10 is single carriageway road. The M11, A14 and A428 are motorways or dual carriageway A-roads and form part of the national Strategic Road Network.

Most sizeable settlements within Cambridgeshire have at least one A-road connection to the highway network. Supporting this is a network of direct connections which link the settlements around the county to one another via lower capacity routes.

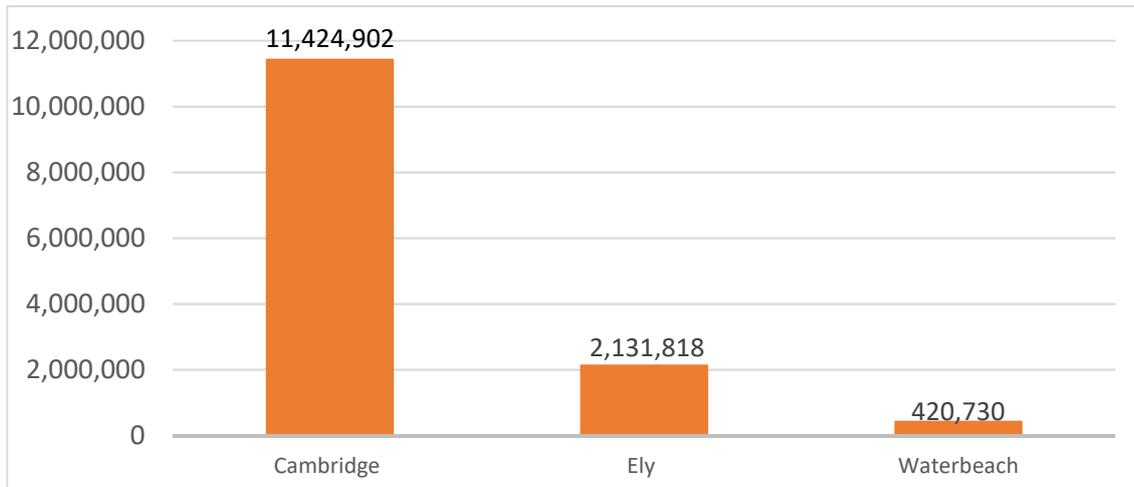

### 2.2.1 Rail

#### High and growing levels of demand, and performance issues on key corridors

Based on data from the Office of Rail and Road (ORR), the following figures compare total passenger entries/exits at Cambridge, Ely and Waterbeach in the study corridor. Cambridge North Station opened only recently in May 2017, and was used by around 2,500 people in its first week of opening. This had grown to around 5,000 people a week by September 2017.

Figure 9 shows that Cambridge station serves over five times as many passengers as Ely station, and nearly thirty times as many passengers as Waterbeach station.

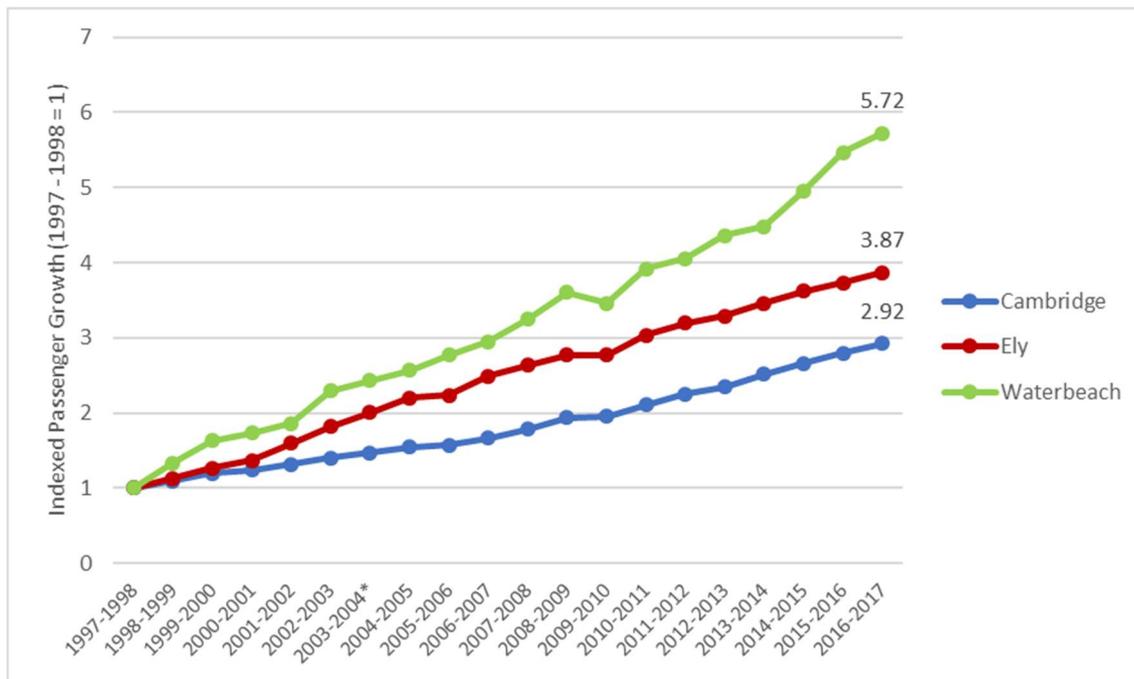

**Figure 9: Total 2016/17 annual passenger entries/exits per station on study corridor**

Source: ORR data

Figure 10 below shows growth of passenger numbers at each station relative to each station's 1997/98 level of passenger throughput.

**Figure 10: Indexed growth in passenger throughput at each study area station**

Source: ORR data (2003 - 2004 figures estimated due to ORR data excluding that year)

This shows that all stations have experienced significant growth in passenger numbers since 1997-98, exceeding the averages for the East Region and for England over the same period. Growth has been proportionately greatest at Waterbeach station, which now handles over five times as many passengers as it did in 1997/98, while Ely is approaching a fourfold increase. While Cambridge station has grown the least, in proportional terms, in absolute terms the

growth it has experienced represents an increase of over seven million passenger entries/exits per year on a 1997/98 base of around four million – a very substantial increase indeed.

This growth is naturally reflected in increased loading of individual train carriages, and in peak periods there are substantial levels of crowding on key services.

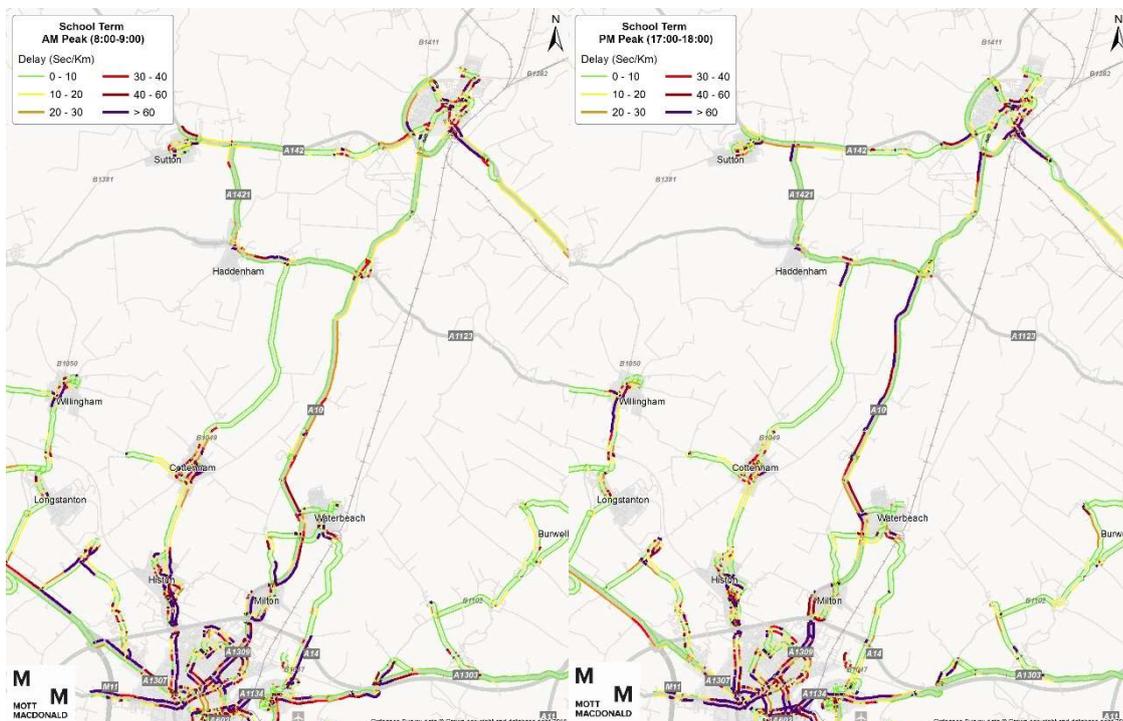

Both the Greater Anglia and Thameslink Great Northern are introducing significant additional carriage capacity over the next two years, on services from Cambridge to London Liverpool Street and Kings Cross, and on regional services across the East of England. This will provide some additional rail capacity between Ely and Cambridge.

### 2.2.2 Bus

In order to undertake the analysis of bus performance within the study corridor, TrafficMaster journey time data was used to calculate the delays per km along different bus routes in the study area. Figure 11 shows numerous southbound delays in the AM peak hour. Delays are notably severe along the A10 from Waterbeach to the Milton Interchange. Following the Milton Interchange, delays worsen along the Milton Road and reach over 2 minutes per kilometre near the Science Park and within Cambridge city centre. Delays are also prevalent on the B1049 from Histon into Cambridge. In the AM peak, there are also significant southbound delays on the Horningsea Road between the A14 and Newmarket Road.

In the PM peak hour, bus journey time delays are less severe. However, there are still significant delays in both directions between the Science Park and Milton Interchange, and northbound between Waterbeach and Stretham roundabout.

**Figure 11: Average journey time delay on bus routes 2013/14 – AM Peak (l) PM Peak (r)**

Source: Traffic Master

### 2.2.3 Park and Ride

The Milton Park and Ride (P&R) site is the only P&R within the study area. It offers 792 parking spaces and is located on the west side of the A10, half a mile north of the Milton Interchange and less than four miles from the city centre.

The Park and Ride service operates every 10 minutes Monday to Saturday. The first bus of the day departs at 06.21 and the last departure from Cambridge City Centre is at 20.39. On Sundays, the service operates every 15 minutes, which begin at 09.00 with the final service returning from Central Cambridge at 18:35. The journey time into the city centre is approximately 16 minutes. Current charges comprise a parking charge of £1, which will be abolished in April 2018, and a return ticket to the city centre for £3.

The Milton P&R site has the lowest capacity and is the least utilised of the five bus-served P&R sites around Cambridge. Historic trends in the usage of the Park and Ride at Milton suggest a decline in patronage since 2014 of 19%.

### 2.2.4 Walking and Cycling

In comparison to the national average, cycle commuting is generally high within the study corridor. The highest cycle flows are found within populated areas and the 'necklace' villages closet to Cambridge. Therefore, the highest levels of cycle trips are concentrated in the southern section of the corridor, with the central rural areas and Ely and its hinterland experiencing lower flows.

There are substantial cycle traffic flows on radial routes in and out of Cambridge on weekdays, suggesting that it is a key mode for commuters and students accessing employment and education sites. The shared footway/cycleway that runs alongside the guided busway is particularly well used, carrying nearly a thousand cycle trips on weekdays. National cycle route 11, which runs from north Cambridge to Waterbeach, and national cycle route 51 (east), which runs through Bottisham and Burwell, both carry between 200 and 400 weekday trips.

Beyond Waterbeach, national cycle routes 51 and 11 are predominately used by leisure cyclists whose journeys take place at the weekends. Cycle data for Ely is limited, but shows a variety of users across the week, with weekday trips being the most numerous.

The highest proportion of cycling commuting also corresponds with where high-quality cycle infrastructure is provided, as demonstrated by the large number of cyclists make use of the Busway cycle route.

A key area of weakness in the study corridor is the lack of cycle routes serving a north to south journeys, with cycling provision along the A10 being particularly poor.

Collision figures involving pedestrians and cyclists are more frequent around populated areas and where changes in the speed limit occur. These collision clusters demonstrate the need for safe and appropriate transport infrastructure where different modes of transport interact.

### 2.2.5 Highway

As noted above, the county's strategic highway routes carry varying designations and have correspondingly varied levels of effective traffic capacity. The volumes of traffic using them also differ significantly by route – and indeed in many cases by time of day and direction of travel. The plots in Figure 12 below, demonstrate this significant variability based on outputs from the County Council's Cambridge Sub-Regional Model (CSRM).

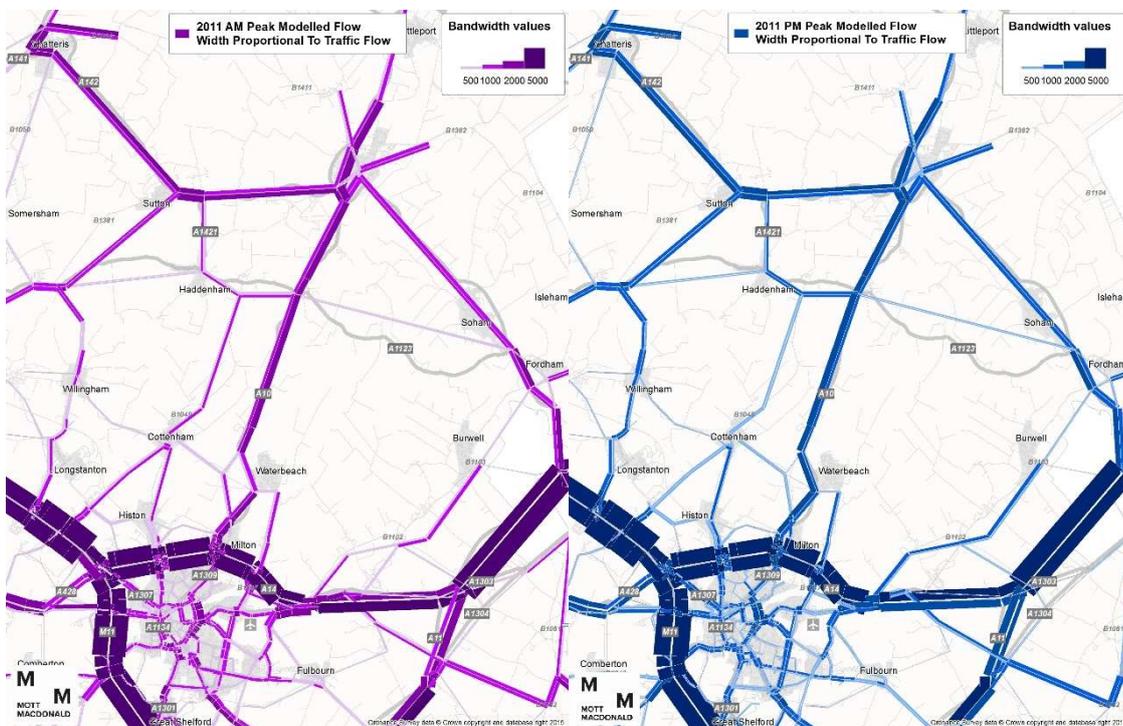

The most heavily used routes by far are the M11 between Cambridge and London (via Stansted), A14 to Huntingdon (dual carriageway), and A14 to Newmarket (dual carriageway), each of which carries upwards of 2,000 Passenger Car Units (PCUs) in each direction in both the morning and evening peak hours

The A10, the single carriageway A-road linking Cambridge and Ely, carries the highest north-south flows in the county. It carries between 1,000 and 2,000 PCUs southbound towards Cambridge in the morning peak hour, and a similar flow northbound in the evening peak/peak hour.

Meanwhile, traffic levels in the ‘counterpeak’ direction are in both cases much lower – around half of the peak direction flow – suggesting that demand in the corridor is very tidal.

The result of this concentration of travel demand is a very significant level of congestion which can extend almost the full length of the A10 from Ely to Cambridge in the morning peak, and from Cambridge to Ely in the evening peak hours.

**Figure 12: Modelled traffic flows in study area – 2011 AM peak (l) and PM peak (r)**

The plots in Figure 13, below, are based on data from TrafficMaster, which aggregates the journey times from a large fleet of vehicles equipped with GPS navigation devices.

The plots show that during peak periods travel times along the A10 are frequently up to 100% longer than during free-flow periods, and are in many places more than 100% longer. Travel times in the counter-peak direction also deteriorate compared to free-flow conditions, but to a far lesser extent, reflecting the strongly tidal pattern of travel along this route across the standard working day.

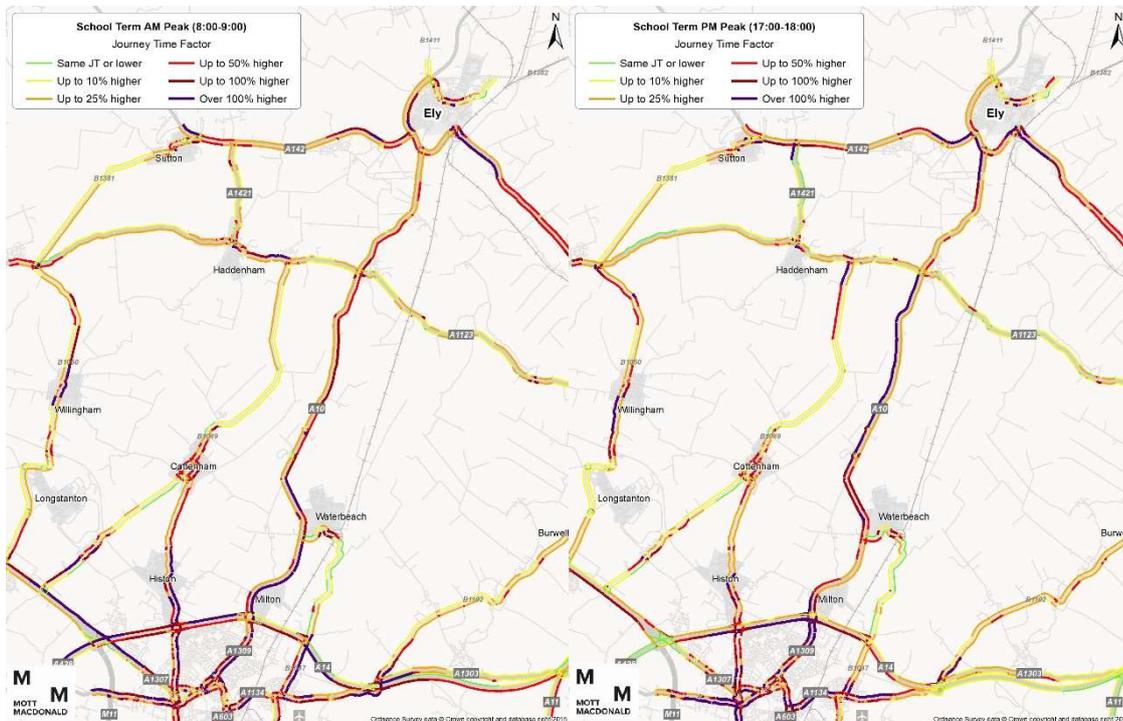

It is also apparent from Figure 13 that the B1049 route (which runs parallel to the A10 and passes directly through two sizeable settlements at Cottenham and Histon) also experiences significant congestion in the peaks. Congestion is particularly apparent southbound at the

approach to the A14 Histon Interchange in the morning peak and northbound at the junction with the A1123 in Wilburton in the evening peak. As well as local traffic demand, this in part reflects a displacement of traffic which would be most appropriately accommodated on the A10, bypassing major settlements, onto less suitable routes as a result of the congestion on the A-road itself. Figure 12 above, shows that traffic flow on the B1049 is around 1,000 PCUs at points southbound in the morning peak and northbound in the evening peak.

On the A14 north of Cambridge, journey times eastbound between junctions 31 (Girton) and 32 (Histon), as well as the approach to the Milton Interchange (J33) take twice as long in peak times than they do in free-flow conditions. In the PM peak, the same is true of the westbound direction.

On the east-west A142 route there are significant delays in both directions in both periods. Notably, journey times are longer for southbound travel in the AM peak, and the opposite in the PM peak. Despite this, Figure 12, shows that traffic flows on the route are less tidal than on the A10.

**Figure 13: Average delay – School term-time 2013/14 – AM Peak (l) PM Peak (r)**

Traffic levels on all these routes are anticipated to grow in future years, thus exacerbating issues that are already being experienced on the transport network, leading to increases in problematic transport impacts. And as the following section will demonstrate, the presence of several proposed major developments on and around the transport links connecting Ely to Cambridge will worsen these issues.

## 2.3 Future Issues and Opportunities

### Growth will bring major opportunities, and intensify some existing challenges

The number of journeys made each day in Cambridgeshire will grow over the coming years as a result of the anticipated population and job growth and the scale of committed and proposed development within the study area.

Ely to Cambridge study area. Table 2 outlines the ONS 2011 sub-national population projections by local authority area. It forecasts significant population growth across the county between 2011 and 2031. The predicted population growth will likely correspond with an increase in commuting trips within the study area. Of particular relevance to this study is the fact that a large proportion of the development taking place in the Cambridge area will be concentrated in sites close to or impacting the Ely to Cambridge study area. Table 2: ONS 2011 Population Projections

Area	2001	Observed Change 2001-09	% Change	2009	Forecast Change 2009-31	% Change	2031
Cambridge City	109,900	9,200	8.4%	119,100	32,700	27.5%	151,800
East Cambridgeshire	70,900	9,400	13.3%	80,300	17,900	22.3%	98,200
Fenland	83,700	9,600	11.5%	93,300	19,900	21.3%	113,200
Huntingdonshire	157,200	7,400	4.7%	164,600	12,200	7.4%	176,800
South Cambridgeshire	130,600	13,000	10.0%	143,600	38,300	26.7%	181,900
Cambridgeshire	552,100	48,700	8.8%	600,800	120,600	20.1%	721,400
Cambridgeshire and Peterborough	707,400	66,200	9.4%	773,600	185,300	24.0%	958,900
East England*	5,400,000	370,100	6.9%	5,770,100	1,246,400	21.6%	7,016,500
England*	49,450,000	2,367,100	4.8%	51,817,100	8,253,600	15.9%	60,070,700

Source: ONS Mid-year population estimates (2011)

As described above, clusters of high tech employment on sites in the Cambridge Northern Fringe are supporting many jobs for the sub-region and creating significant economic value. Consequently, there is a clear incentive to facilitate further growth at these sites. Planning policy across the City of Cambridge, South Cambridgeshire, and East Cambridgeshire seeks to address this need both directly (through large scale release of land close to the existing cluster to B1, B2 and B8 development), and indirectly (by enabling further growth in housing supply, where currently constraints are acting as an impediment to business growth in and around Cambridge).

Within the study area, the three most significant of these proposed developments are those at Cambridge Northern Fringe East (CNFE) and at the Cambridge Science Park (CSP) adjacent to it, and three miles further north, north of Waterbeach village at the site of the former Waterbeach Barracks and on adjacent land.

Together with development at Ely, these developments should enable existing businesses to expand, both by offering physical floorspace for expansion and by providing residential space for new employees to live in, and by the same token should attract other businesses in related sectors who are likely to see benefits in joining a tightly agglomerated economic cluster offering a ready pool of experienced labour to take up new opportunities as they become available.

This development will help to address the pressing issue of constrained housing supply and rising prices in Cambridge, and by providing both space to expand and space for workers to live, will enable businesses in the thriving knowledge economy to grow.

However, as the following section will show, growth will lead to increased demand for north-south travel along the A10 and the road, public transport, pedestrian and cycle routes around it. Although the development of Cambridge North Station and additional services linking with the Cambridgeshire Guided Busway have significantly improved public transport connections to and from these southern sites, road and rail connections are already under significant strain. The addition of further travel demand will exacerbate these issues and make consideration of complementary transport measures essential.

## 2.4 Impacts of Growth

The separate Strand 1 Options Modelling Report describes in detail an analysis of the modelled performance of the A10 highway corridor showing the impacts of the proposed Waterbeach new town, CNFE and CSP developments, in the absence of any measures to mitigate transport impacts.

The modelling tool used in the analysis is Cambridgeshire County Council's Cambridge Sub-Regional Model (CSRM2). CSRM2 is a WebTAG-compliant strategic highway model which uses base data from 2015, including:

- Validation against recently collected traffic and transportation counts
- All networks (highway, PT, walk, cycle)
- Representation of parking and Park & Ride
- Base transport movement data
- Base land use data
- Matrices with up-to-date mobile phone data

Cambridgeshire County Council have agreed that they consider the model to be fit for purpose for use in the assessment of this phase of the project.

Comparing statistics from the 2031 modelled year with and without the development sites outlined above (and assuming no change in transport provision between the two scenarios), the key implications for the A10 and surrounding roads are set out below.

### Travel demand on the A10 and surrounding routes would increase

The following paragraphs consider the transport impacts of planned development as they would occur without any provision infrastructure or services to cater for the new transport demand. The report then goes on to explore potential mitigation measures.

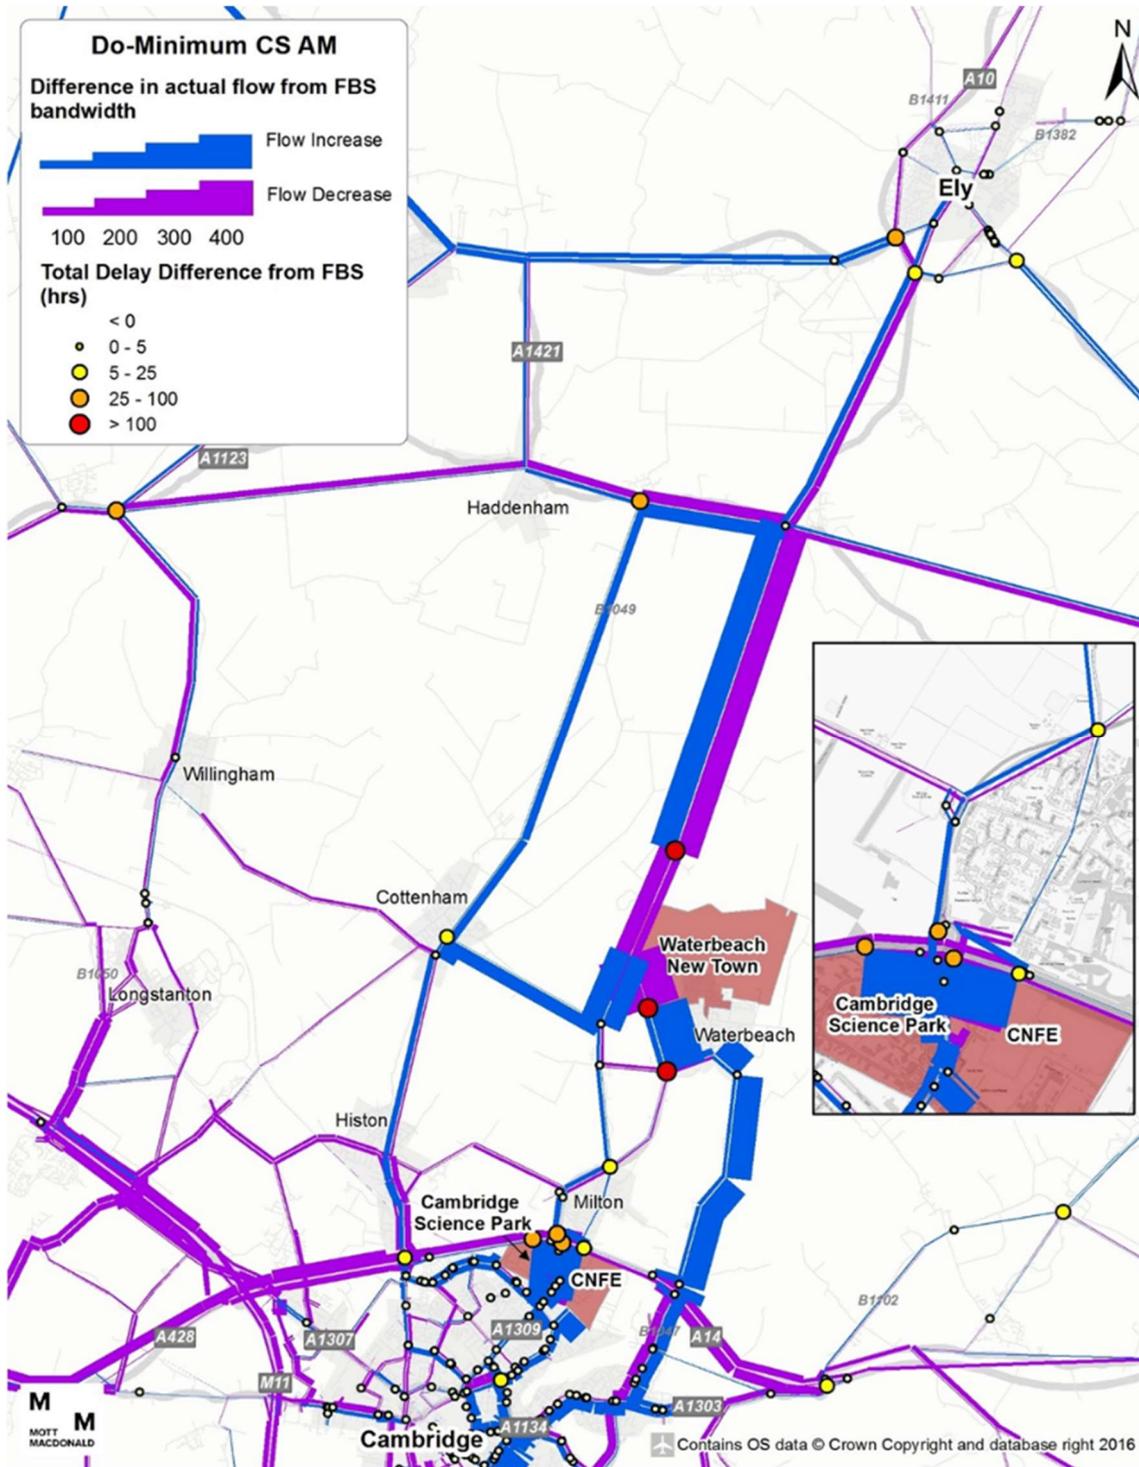

The development of these sites is likely to lead to significant change in travel demand along and around the A10, with the overall proportion of trips with both local origins and local destinations increasing, as the development adds many more such trips to the A10 at the expense of trips with both external origins and external destinations which nearly halve in proportion, reflecting the greater availability of alternative routes (and frequently leading to increases in traffic along less suitable routes or indeed increasing pressure on other strategic network links).

The overall impact of development on traffic levels and delay can be seen in Figure 14, showing a comparison of two scenarios in the 2031 modelled year, one in which the development sites adjacent to the A10 are not implemented, and a second in which the development takes place as outlined above without any mitigating transport measures.

It is notable that while there is growth at some points along the A10, the main impact is in fact an increase in traffic on nearby routes. The negligible change in traffic levels evident south of the Waterbeach development on the A10 itself essentially demonstrates that the effective capacity of the route has already been reached, even without the implementation of the development, and that new trips arising here from the development sites can therefore only be accommodated at the expense of other existing traffic which is displaced to other routes.

Some sections of the A10 are projected to experience reductions in traffic volumes as a result of development. This is principally a reflection of the impact of traffic accessing the Waterbeach development which adds delay to junctions on the route, and thereby leads to the displacement of longer distance traffic which has a route choice onto neighbouring routes – most particularly the B1047 Clayhithe Road but also the B1049 through Cottenham.

**Figure 14: Change in traffic flows and junction delays resulting from development at Waterbeach, CNFE and CSP (AM peak 2031)**

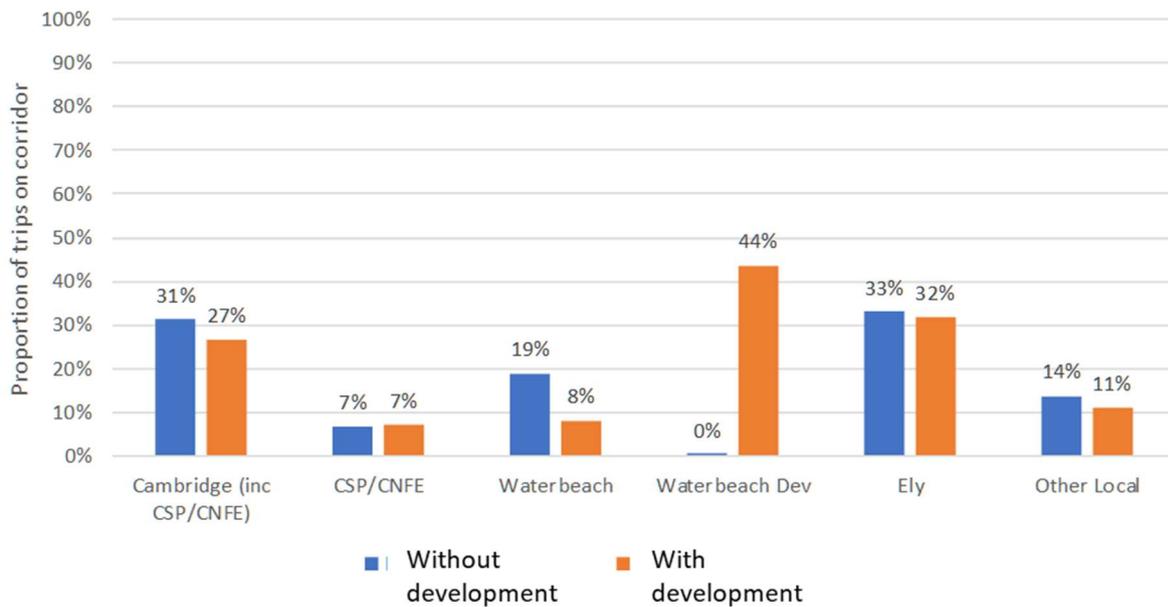

Source: Mott MacDonald/OS

Significant additional delays are evident at three junctions on the A10 – all close to the Waterbeach development, while there are also projected to be additional delays at the junctions on the A10/A14 to the north of the Science Park and Northern Fringe developments. More

modest increases in delay are also visible at many junctions in inner Cambridge, along Kings Hedges Road, Milton Road, and Horningsea Road.

The chart in Figure 15 below, shows the proportion of trips on the A10 corridor which are predicted to be generated by the local locations shown both with and without development. (Note that because some trips pass through more than one location, individual values should not be added together as this would result in double-counting.)

**Figure 15: Distribution of trips on A10N corridor by site of origin in 2031**

Source: Mott MacDonald

The chart shows how significantly the development at Waterbeach is likely to affect the makeup of traffic on the A10 between Ely and Cambridge – once implemented in full, the modelling indicates that it would be the origin or destination for some 44% of all travel demand on the route.

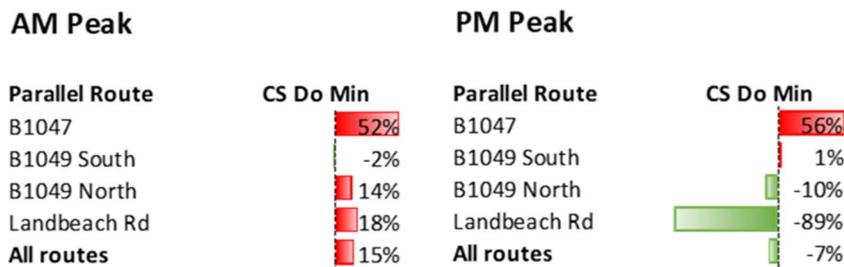

It is also noticeable that the increased development at both the Science Park and Cambridge Northern Fringe East sites does not lead to an overall increase in the proportion of these trips on the corridor (notwithstanding that in absolute terms there is an increase in trips). A key reason for the relatively modest impact on the A10 from these sites is that traffic to and from the Science Park and Northern Fringe sites can use alternative routes such as the A14 and the B1049, and the A10 is slower than these routes for many of those trips without any mitigation. However, traffic to and from the new town north of Waterbeach has no choice but to use the A10 as it is the only road connecting to the site.

Overall, the modelling indicates that an average of 39% of background traffic will be displaced from the A10 as the trips generated by the new developments take up a large proportion of the constrained capacity of the route.

## Traffic would increase on some routes parallel to the A10

Figure 16 sets out the level of traffic changes on each of the main parallel routes to the A10 by comparing with and without development scenarios in 2031. It is notable that with the exception of the B1047 which would see substantial increases in traffic in both the AM and PM peaks, the increases are otherwise concentrated in the AM peak.

Figure 16: Changes in traffic levels on parallel routes

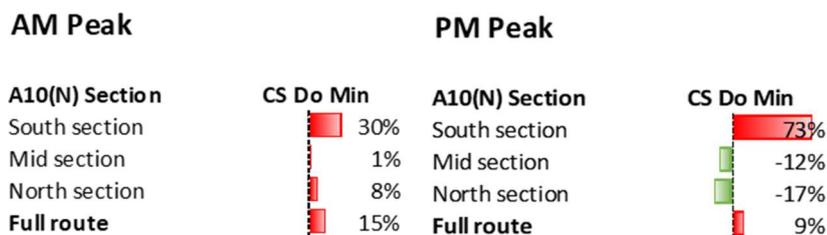

Source: Mott MacDonald

## Journey times would increase on key routes

Even with large amounts of traffic being displaced to other routes, the traffic generated by the development is likely to lead to significant increases in journey times along sections of the A10 between Ely and Cambridge (up to 73% in the evening peak hour at the southern section), and an overall increase of around 15% and 10% in journey times along the whole Ely to Cambridge section of the A10 in the AM and PM peak respectively, as shown in Figure 17, below (again this compares the with and without development scenarios in 2031).

Figure 17: Journey time impacts of growth

Source: Mott MacDonald

Given that (as outlined above) peak period journey times along some sections of the A10 are already as much as double the free-flow times, such increases would add further to an already problematic level of delay.

## Car mode share would fall

The modelling indicates a likelihood of a statistically significant (5%) reduction in the share of trips along the Ely to Cambridge corridor which are undertaken by car in the AM peak hour, a slight increase in car mode share in the PM peak hour, and a slight decrease across the overall modelled network. This indicates that the concentration of development in locations close to

Cambridge with good public transport and walking and cycling access tends to facilitate more sustainable travel patterns than siting development elsewhere.

**Figure 18: Change in car mode share levels**

**AM Peak**

Area	CS Do Min
Study corridor	-5.3%
Modelled network	-1.06%

**PM Peak**

Area	CS Do Min
Study corridor	0.5%
Modelled network	-0.87%

Source: Mott MacDonald

The modelling results described above confirm that the major developments proposed along the A10, and in particular the Waterbeach development, would further exacerbate existing and future problems for travel on key routes in the county if implemented without some form of complementary transport measures.

Some impacts would be felt mostly by those already living and working in Cambridge, notably those close to some of the routes running parallel to the A10 who would see traffic and journey times increase as traffic is displaced from the A10 by new traffic from the developments. Other effects, such as the increase in journey times on the A10, might actually undermine the prospects of the new developments themselves by reducing the accessibility of the sites and thereby making them relatively less attractive places to expand or set up businesses.

In order to capture the many positive benefits of this development for the economy of the county and indeed the UK as a whole, without causing detriment to those already living and working in the area, it is therefore essential to develop a suitable package of complementary transport measures.

The process of identification of potential measures and sifting and prioritisation among them is described in the following sections.

**2.5 Addressing the Challenges**

Following a review of the emerging and policy objectives, the following Objectives have been defined in consultation with project team. The objectives are set out in the study brief and have been identified in response to the problems and opportunities highlighted in the accompanying Evidence Base Report, and refined through examination of objectives set out in key transport policy documents for the county – notably the Transport Strategy for Cambridge and South Cambridge, the Third Cambridge Local Transport Plan, and the Cambridgeshire Long Term Transport Strategy.

Table 3 summarises these agreed objectives.

**Table 3: Summary of Study Objectives**

ID	Scheme Objective
1	Maintain traffic at or below 2011 traffic levels in Cambridge
2	Minimise vehicle mileage whilst providing for increased travel demand
3	Improve reliability, capacity and speed of alternative transport modes
4	Minimise potential impact on alternative "rat-runs" to the A10
5	Intercept or substitute car trips with alternative transport modes
6	Address transport demand from the new town north of Waterbeach
7	Enable development in the Cambridge North Fringe East/Cambridge Science Park to proceed

Source: Mott MacDonald and Cambridgeshire County Council

These objectives will ensure that the package of interventions is fully realised and is able to address the need for intervention, as well as helping to meet local strategic priorities.

## 2.6 Scope of Options

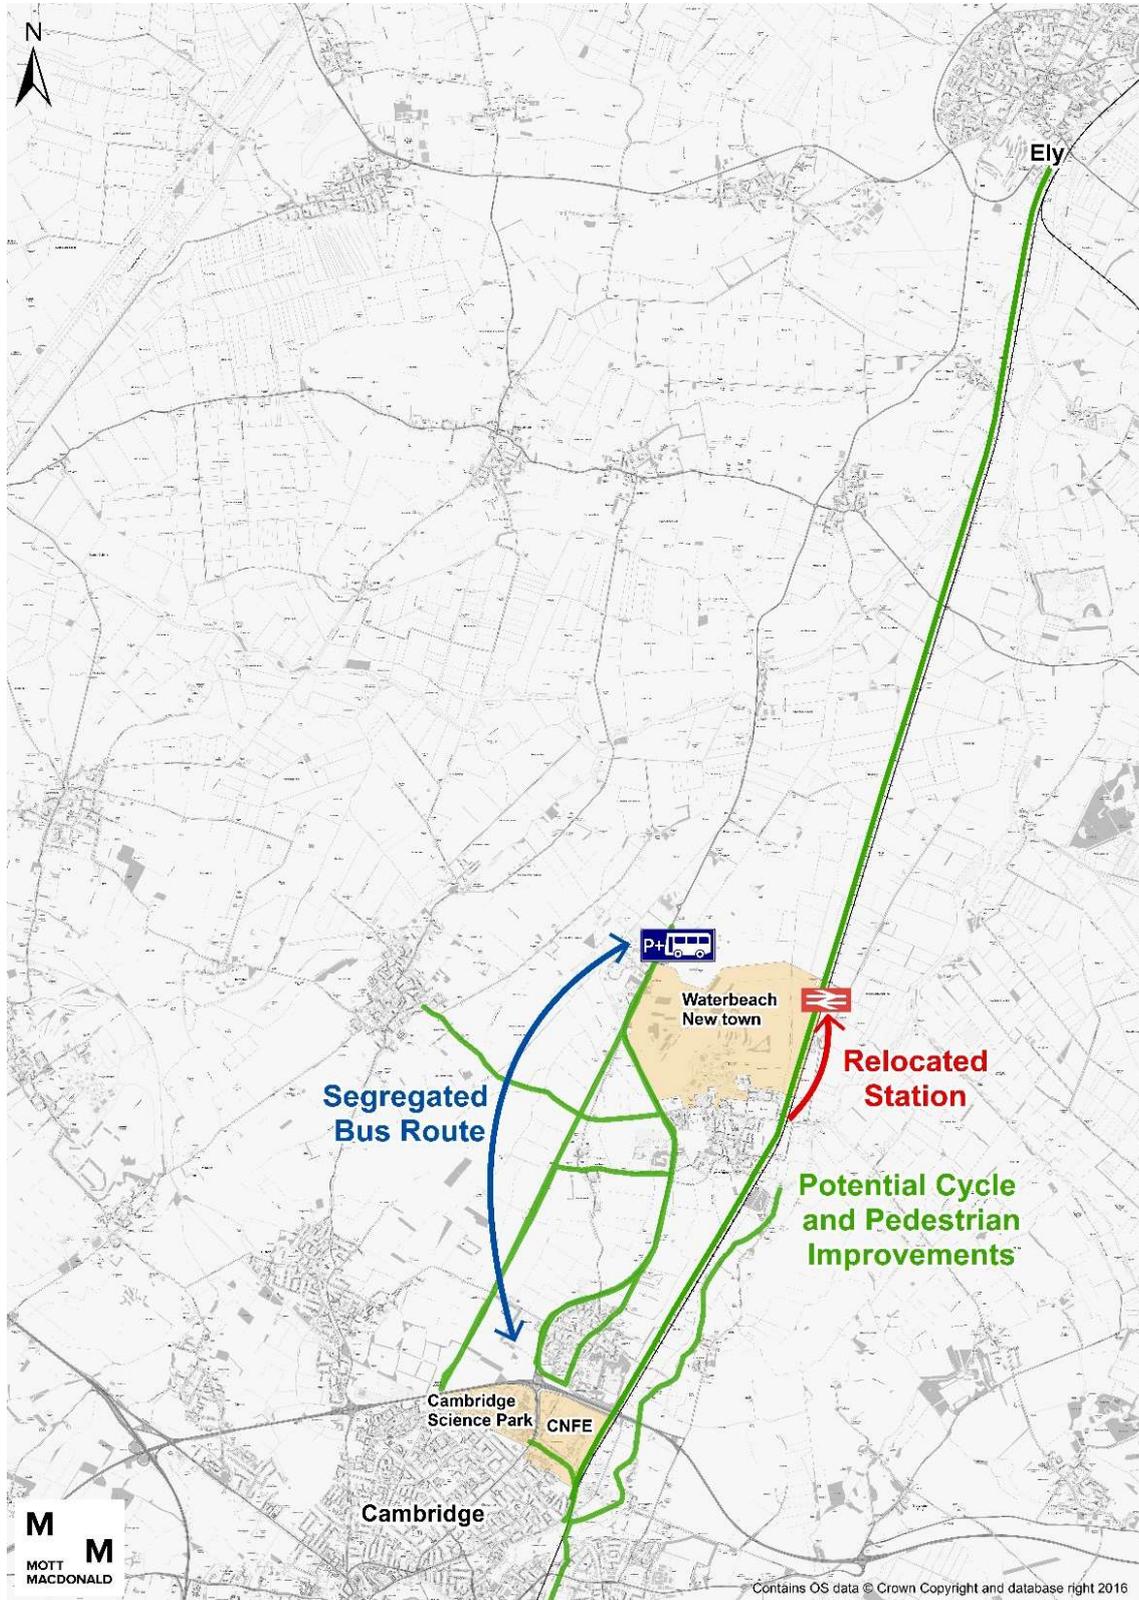

The objectives clearly highlight the role of all modes of transport in addressing the challenges in the Ely to Cambridge corridor. The options assessed will therefore include a package of multi-modal interventions as a minimum requirement, with additional options entailing increasing levels of interventions on the highway network. This approach is described further in the Strand 1 Options Modelling Report.

In light of the objectives described above, a set of potential packages has been developed. Broadly, these packages represent incrementally greater levels of intervention – ranging from packages including only measures focused on non-highway measures through to packages with an increasing level of complementary highway intervention.

This range of packages and the rationale behind them is described in the following table, and shown schematically in the five figures beneath.

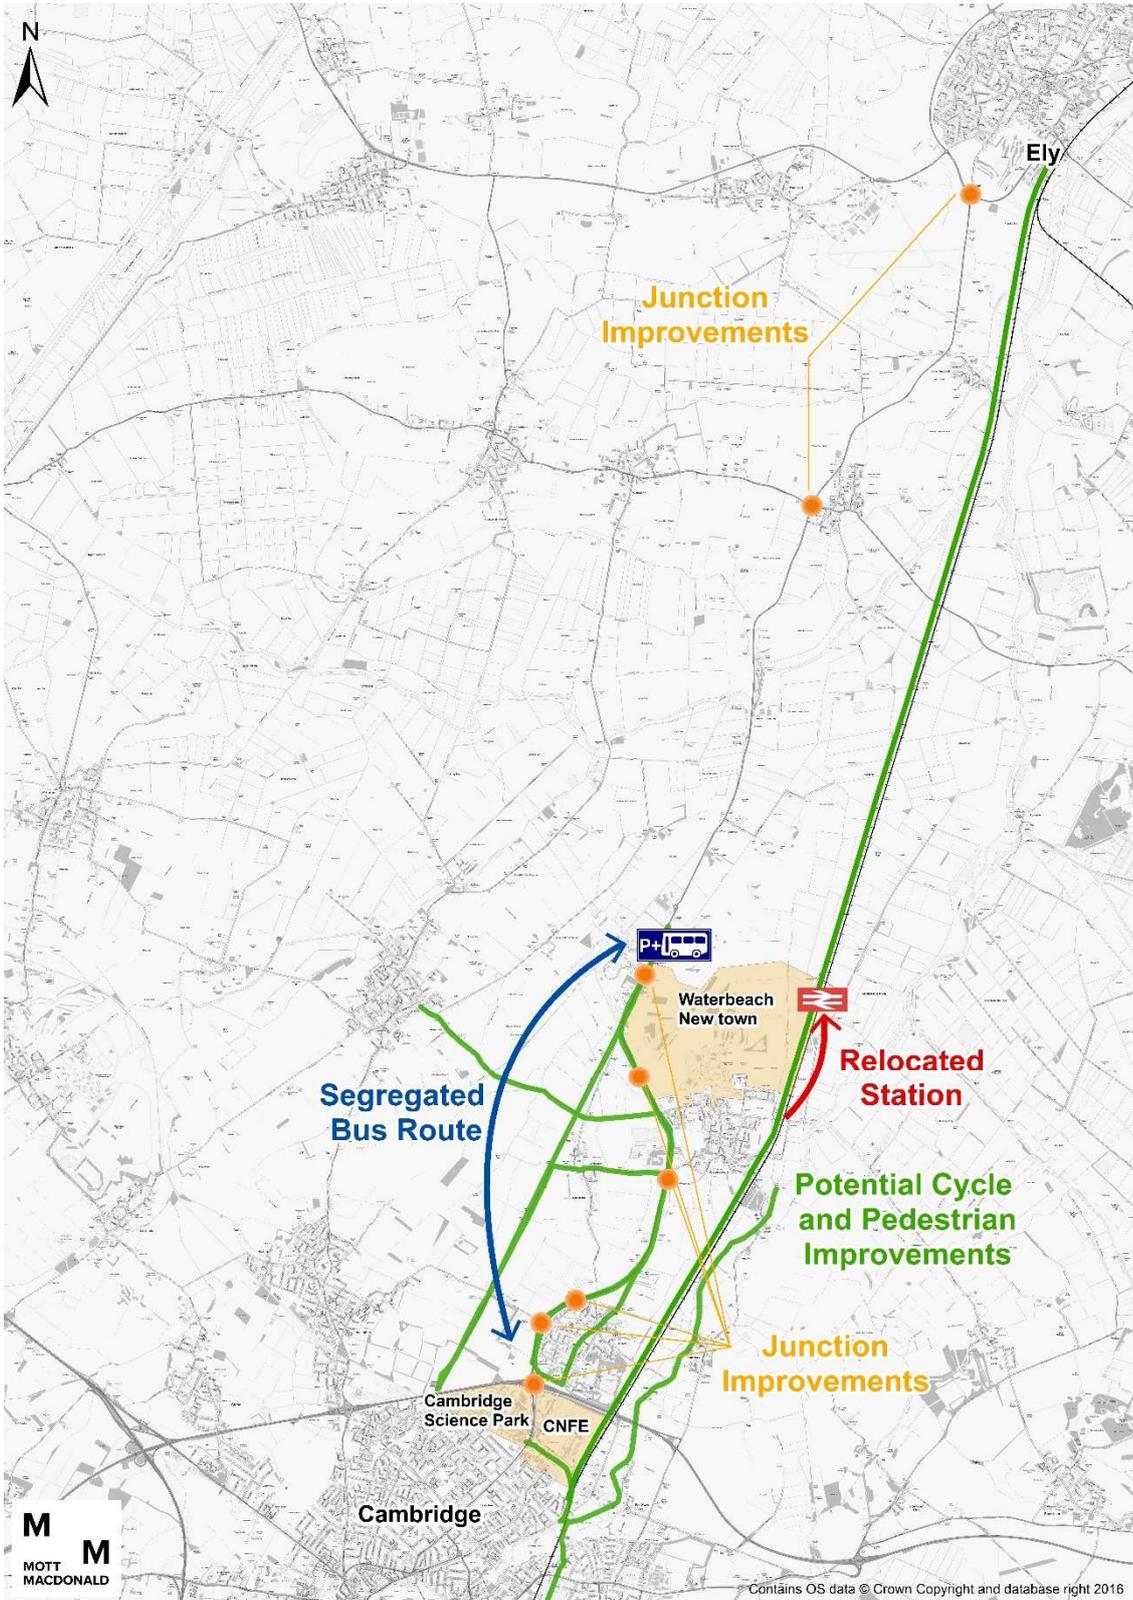

Package	Description	Rationale
<b>Mode-shift</b>	Measures to encourage mode shift, including: <ul style="list-style-type: none"> <li>• New or improved walking/cycling routes between Ely, Waterbeach and Cambridge</li> <li>• New high-quality segregated public transport provision (route TBC) between Waterbeach development and Cambridge</li> <li>• New park and ride sites at Waterbeach development, to remove car trips from southern section of A10</li> <li>• Existing Waterbeach railway station relocated closer to Waterbeach development</li> </ul>	To test the impact of non-highway interventions only
<b>Junction +</b>	Mode-shift option measures, together with additional junction improvements to Ely to Cambridge corridor, including: <ul style="list-style-type: none"> <li>• Improved capacity on the slip roads joining the roundabout and from Cambridge Road at Milton Interchange</li> <li>• Increased capacity for vehicles travelling northbound on the A10 at the Milton Park and Ride southern access, whilst keeping the left slip to access the P&amp;R site.</li> <li>• Increased capacity on the southern A10 at the Butt Lane junction for flow travelling northbound, and on the Butt Lane arm, with left turns only still being implemented.</li> <li>• Improved capacity on Landbeach Road and Humphries Way junctions on the A10</li> <li>• Increased capacity on Car Dyke Road and Waterbeach Road junctions on the A10.</li> <li>• Increased capacity from the site and on the southern A10 arm at the southern access to the Waterbeach Development.</li> <li>• Increased capacity on Green End at the junction with the A10</li> <li>• Increased capacity on the site access arm at the northern access to the Waterbeach development</li> <li>• Increased capacity at the A10 / A1123 roundabout in Stretham.</li> <li>• Increased capacity at the A10 / A142 Angel Drove roundabout at Ely.</li> </ul>	To test the impact of adding a first level of highway improvements
<b>North-dual</b>	As per 'Junction+' option, but with the A10 upgraded to dual carriageway from the Waterbeach development's northern access north to Ely – alignment to be determined	To test the impact of a further highway upgrade, which encourages use of Waterbeach Park and Ride to Cambridge
<b>South-dual</b>	As per 'Junction+' option, but with the A10 upgraded to dual carriageway from the Waterbeach development's southern access south to the A14 Histon Interchange – alignment to be determined	To test the impact of upgrading capacity on the southern half of the corridor, where it is most needed
<b>Full-dual</b>	As per 'Junction+' option, but with the A10 upgraded to dual carriageway along the entire length from the A14 Histon Interchange to Ely – alignment to be determined	To test the impact of a full corridor dual carriageway upgrade

## 2.7 Model Testing

To inform an assessment of the effectiveness and suitability of these options, the schemes in each of these packages were incorporated into scenarios within the transport model, together with the development proposals, producing forecasts of their impacts. This work is documented in full in the Strand 1 Options Modelling Report completed in parallel with this report.

The modelling work is based on two future modelling scenarios as follows:

- The 'Future Base' case – this represents the 2031 scenario where Local Plan projected levels of population and employment growth have been achieved for Cambridgeshire, but where the proposed developments at Waterbeach new town, CNFE and CSP do not take place. This therefore represents the 'without development' scenario for the A10.
- The 'Combined Scenario' case – this represents the 2031 scenario where Local Plan projected levels of population and employment growth have been achieved for Cambridgeshire and where the proposed developments at Waterbeach new town, CNFE and CSP take place. This therefore represents the 'with development' scenario, though without any additional transport investment, and is regarded as the Do-Minimum scenario.

The addition of the above mitigation package options to the Combined Scenario Do-Minimum case results in a Combined-Scenario 'Do Something' network. Each of the Combined-Scenario Do-Something network options below was then compared against both the Combined-Scenario Do-Minimum situation and the Future-Base Do-Minimum situation in order to understand the effectiveness of each mitigation package against both the unmitigated 'with development' case and the 'without development' case respectively.

It should be noted that all modelling results presented below are for the AM and PM weekday peak hours, which are:

- AM peak: 08:00-09:00
- PM peak: 17:00-18:00

In order to provide a summary of the modelled mitigation package performance, each Do Something package model run is compared against the equivalent Do Minimum run across three key model performance indicators:

- Car mode share
- Journey time
- Parallel route traffic level

The results of the scenarios in each of these respects is set out below.

### 2.7.1 Car Mode Share

Figure 24 shows the modelled change in car mode share levels for the Combined-Scenario Do-Minimum situation and each Combined-Scenario Do-Something mitigation package compared to the Future-Base Do-Minimum situation.

Car mode share is a primary measure of the relative sustainability of trip-making on and beyond the corridor, where a lower result is generally regarded as better. It is measured both for trips most likely to use the study corridor and for the whole modelled area, and is defined as absolute change from Future Base Do Minimum car mode share.

The results listed are taken from the above analysis and are based on all weekday AM and PM peak hour trips:

- Between sectors most likely to use the study corridor
- Across the full modelled network

**Figure 24: Change in car mode share levels compared to Future-Base Do-Minimum**

**AM Peak**

Area	CS Do Min	CS Mode Shift	CS Jn+	CS North Dual	CS South Dual	CS Full Dual
Study corridor	-5.3%	-8.8%	-8.4%	-7.9%	-6.8%	-5.9%
Modelled network	-1.06%	-1.11%	-1.08%	-1.05%	-0.98%	-0.92%

**PM Peak**

Area	CS Do Min	CS Mode Shift	CS Jn+	CS North Dual	CS South Dual	CS Full Dual
Study corridor	0.5%	-2.1%	-1.7%	-1.4%	-0.6%	0.0%
Modelled network	-0.87%	-0.89%	-0.82%	-0.81%	-0.75%	-0.71%

Source: Mott MacDonald

These results show that:

- Compared to the Future-Base Do-Minimum (the ‘without development’ case), the Combined-Scenario Do-Minimum (the unmitigated ‘with development’ case) results in a significant decrease in the car mode share of trips using the Ely to Cambridge corridor in the AM peak hour, and a slight increase in the PM peak hour. Across the modelled network, the scenario results in an overall car mode share decrease. This therefore indicates that the concentration of development in locations close to Cambridge, rather than being dispersed across the county, results in more sustainable travel patterns overall.
- Compared to the Combined-Scenario Do-Minimum, the five Do-Something mitigation packages all result in an improved car mode share on the Ely to Cambridge corridor, with a descending level of improvement from the Mode-Shift option to the Full-Dual option. At a modelled network level, improvement against this scenario is seen for the non-dualling mitigation options only, but all Do Something packages show a car mode share reduction against the Future-Base Do-Minimum scenario in all cases.

In summary, therefore, all the Do Something mitigation packages deliver a car mode share reduction on the Ely to Cambridge corridor when compared to the equivalent Do Minimum scenario, with the Mode-Shift package delivering the greatest reduction, and the Full-Dual package the least.

**2.7.2 Parallel route traffic levels**

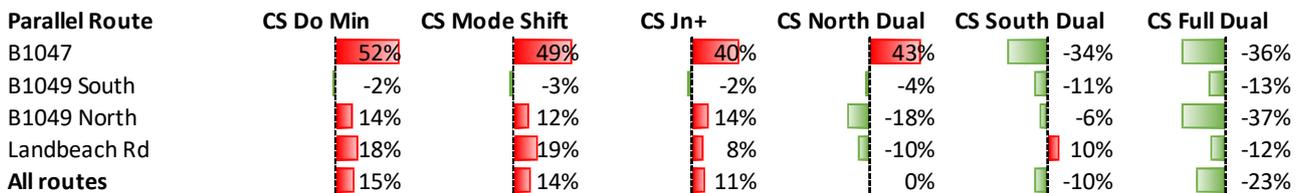

Figure 25 shows the change in modelled traffic levels on routes parallel to the A10(N) corridor for the Combined-Scenario Do-Minimum situation and each Combined-Scenario Do-Something mitigation package compared to the Future-Base Do-Minimum situation.

Displacement of traffic onto unsuitable parallel routes through the addition of new traffic to the A10 itself is a key area of concern for any proposals in this area, and hence a lower result is regarded as better. Parallel route traffic levels are measured across the B1049 (Histon Road

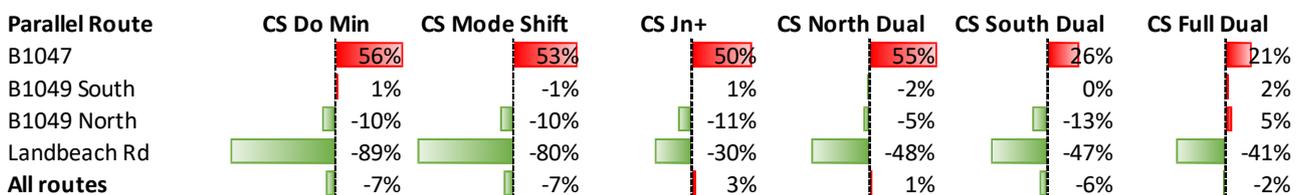

and Twenty Pence Road), the B1047, and on Landbeach Road, in percentage change from Future Base Do Minimum traffic levels.

**Figure 25: Change in parallel route traffic levels compared to Future-Base Do-Minimum**

**AM Peak**

**PM Peak**

Source: CSRM

These results show that:

- For the B1047 route, the Combined-Scenario Do-Minimum (the unmitigated ‘with development’ case) results in an increase in traffic levels compared to the Future-Base Do-Minimum (the ‘without development’ case). This increase is progressively addressed by each Do-Something mitigation package, with the Mode-Shift option yielding the least improvement and the Full-Dual option the greatest. In the AM peak, the South-Dual and Full-Dual options are also able to deliver improvements over the Future-Base Do-Minimum situation, though not in the PM peak.
- For the B1049 route, results are mixed. On the southern section, very little change from Future-Base Do-Minimum traffic levels are seen in any of the Combined-Scenario cases. On the northern section in the AM peak, there is a distinction between the dualling and the non-dualling options, with the former delivering improvements and the latter not while, in the PM peak, all Combined-Scenario cases apart from the Full-Dual option deliver improvements. Overall, though, the impact of the mitigation packages for this route is generally positive.
- Landbeach Road shows similar results to the B1049 in the AM peak, with the dualled mitigation options generally performing better than the non-dualled options, and with all options except Mode-Shift delivering improvements over the Combined-Scenario Do-Minimum. In the PM peak, however, all mitigation options perform progressively worse than the Combined-Scenario Do-Minimum, but still substantially better than the Future-Base Do-Minimum.

Overall, all Do Something mitigation options perform better than the Combined-Scenario Do-Minimum situation or the Future-Base Do-Minimum in both peak hours, except for the Junction+ and North-Dual options in the PM peak. However, only the South-Dual and Full-Dual options

deliver an overall improvement against the Future-Base Do-Minimum scenario in both peak hours.

### 2.7.3 Journey time

Figure 26 shows the change in modelled two-way highway journey times on the A10(N) corridor for the Combined-Scenario Do-Minimum situation and each Combined-Scenario Do-Something mitigation package compared to the Future-Base Do-Minimum situation.

Journey time is the primary measure of corridor performance, where a lower result is regarded as better. It is measured here on the A10 between the A14 and Ely bypass, as a percentage change from Future Base Do Min journey time.

The journey times are shown by route section and for the full route, where the sections are as follows:

- South section – Milton Interchange to Cambridge Research Park
- Mid section – Cambridge Research Park to Stretham roundabout
- North section - Stretham roundabout to Ely bypass

**Figure 26: Change in Ely to Cambridge Corridor journey time compared to Future-Base Do-Minimum**

#### AM Peak

A10(N) Section	CS Do Min	CS Mode Shift	CS Jn+	CS North Dual	CS South Dual	CS Full Dual
South section	30%	26%	26%	36%	-26%	-10%
Mid section	1%	3%	4%	-40%	18%	-40%
North section	8%	8%	3%	-37%	10%	-37%
<b>Full route</b>	15%	14%	13%	-6%	-3%	-26%

#### PM Peak

A10(N) Section	CS Do Min	CS Mode Shift	CS Jn+	CS North Dual	CS South Dual	CS Full Dual
South section	73%	73%	77%	88%	6%	44%
Mid section	-12%	-10%	-13%	-54%	3%	-46%
North section	-17%	-16%	-53%	-72%	-49%	-68%
<b>Full route</b>	9%	10%	-5%	-22%	-19%	-31%

Source: CSRM

These results show that:

- Compared to the Future-Base Do-Minimum, the south section of the A10 shows the greatest journey time deterioration in the Combined-Scenario cases. This is because this is the section which experiences the greatest increases in demand with the proposed developments in place. This deterioration is improved the most by the South-Dual and Full-Dual options, delivering an overall improvement in the AM peak but not in the PM peak.
- On the mid and north sections in the AM peak, the situation is reversed, with only the North-Dual and Full-Dual options delivering improvements against the Future-Base Do-Minimum, as these options add link capacity to these sections. In the PM peak, however, all Combined Scenario cases improve over the Future-Base case on these sections, except the South-Dual option on the mid section.

- Overall, when measuring across the full route, all Do Something mitigation options show a journey time improvement against the equivalent Do Minimum case in both peak hours, except for the Mode-Shift option in the PM peak. However, only the three dualling options deliver an improvement against the Future-Base Do-Minimum situation in both peak hours.

### 2.7.4 Modelling results summary

The following table summarises, for the above three key modelling performance indicators, the level of improvement delivered by each Do Something mitigation package when compared to:

- The Future-Base Do-Minimum case (the ‘without development’ scenario)
- The Combined-Scenario Do-Minimum case (the unmitigated ‘with development’ scenario)

**Table 4: Improvement over Future-Base and Combined-Scenario Do-Minimums in both peak hours**

Indicator	Mode-Shift	Junction+	North-Dual	South-Dual	Full-Dual
Car Mode Share (corridor)	✓✓	✓✓	✓✓	✓✓	✓✓
Parallel Route Traffic Levels	✗✗	✗✗	✗✗	✓✗	✓✗
Journey Time	✗✗	✗✓	✓✓	✓✓	✓✓

Source: MM

This table shows a general progression in performance benefits from the mode shift package towards the full dual carriageway upgrade package as follows:

- The Mode-Shift option, which involves non-highway measures only, delivers mode share improvements, but not highway performance improvements.
- The Junction+ option, which includes the non-highway measures but also modest highway measures, shows a mode share improvement, but also some journey time improvements. It doesn’t, however, deliver overall parallel route traffic level improvements.
- The North-Dual option, which includes the non-highway measures but also more substantial highway measures, shows a mode share improvement, but also full journey time improvements. Similarly, though, it fails to deliver overall parallel route traffic level improvements.
- The South-Dual and Full-Dual options are the only ones to deliver overall improvements in all three performance indicators when compared against the Future-Base Do-Minimum option.

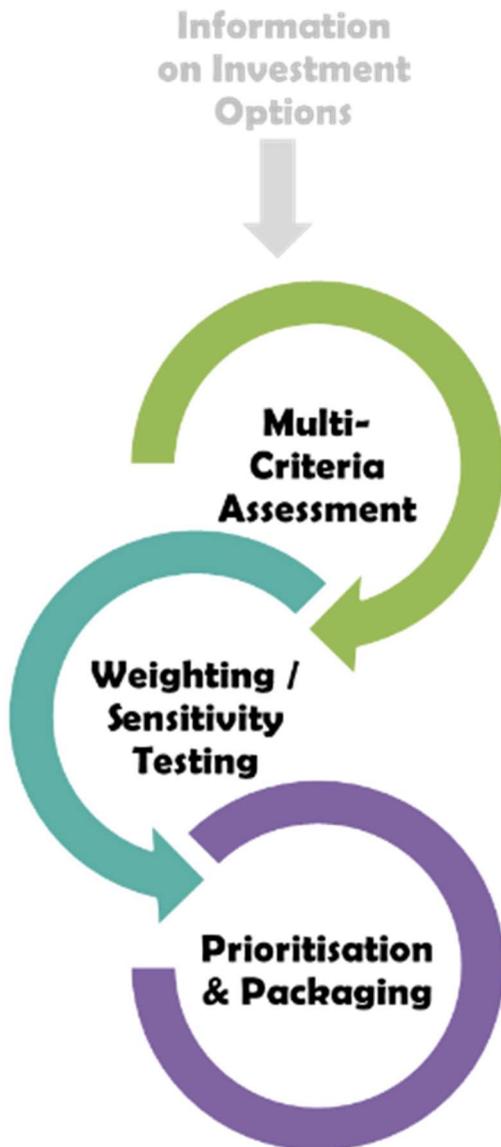

In the subsequent section, these outputs are assessed within the wider context of the full SOBC objectives defined above in order to identify a preferred option.

## 2.8 INSET Appraisal

In order to guide the selection of the most appropriate options, the five intervention options appraised in the traffic modelling scenarios have been subjected to a multi-criteria option appraisal using Mott MacDonald’s Investment Sifting and Evaluation Tool (INSET).

INSET is a decision support toolkit based on Green Book compliant multi-criteria decision analysis and DfT’s early assessment and sifting tool, ‘EAST’. The INSET process is illustrated in Figure 27.

**Figure 27** Outline of the INSET Appraisal Process

Source: Mott MacDonald

For this project the appraisal criteria have been developed around the project objectives, enabling a tailored assessment of the performance of the options against each criterion. Individual criteria have also been weighted to reflect their relative importance.

This section first sets out the INSET appraisal process in terms of the definition of themes, criteria and sub-criteria, before moving on to an examination of the scores applied and the weightings assigned.

The weighted scores for the options are then presented at the end of the section.

### **2.8.1** Definition of Scoring Criteria

The INSET appraisal is organised according to a hierarchy of themes, main criteria and sub-criteria. These are outlined in detail below:

- **Themes:** Represent broad policy or strategy categories that enable the main package or scheme criteria to be classified and weighted differently, depending on local priorities
- **Main Criteria:** Correspond to specific package or scheme objectives, classified into the themes defined above
- **Sub-Criteria:** Comprises measurable metrics that can be used to appraise the degree to which each package or scheme objective/main criterion has been met

For the purposes of this appraisal, three themes have been defined; Strategic Outcomes, Transport Outcomes and Cost Implications. The first two themes cover the study objectives set out in Table 3, above and defined in the study brief, whilst the third theme is intended to enable the perceived benefits of the scheme to be balanced against the likely costs, as defined in Section 3.

The *main criteria* simply set out the seven scheme objectives. For the purposes of the INSET appraisal, Scheme Objective 7 was separated into two parts so that the benefits of the options for access to Cambridge Science Park and Cambridge Fringe North East could be appraised separately. The *themes* and *main criteria* are outlined in Table 5 below.

**Table 5: Summary of INSET Themes and Study Objectives**

ID	Theme	ID	Main Criteria
A	Strategic Outcomes	6	Address transport demand from the new town north of Waterbeach
		7a	Enable development in the Cambridge Science Park to proceed
		7b	Enable development in the Cambridge Northern Fringe East to proceed
B	Transport Outcomes	1	Maintain traffic at or below 2011 traffic levels in Cambridge
		2	Minimise vehicle mileage whilst providing for increased travel demand
		3	Improve reliability, capacity and speed of alternative transport modes
		4	Minimise potential impact on alternative "rat-runs" to the A10
		5	Intercept or substitute car trips with alternative transport modes
C	Cost	-	N/A

Source: Mott MacDonald

Sub-criteria were then defined against each of the main criteria to enable an appraisal of each package based on measurable data from the transport models. These are outlined in **Table 6** below.

**Table 6: Summary of INSET Sub-Criteria**

ID	Main Criteria	ID	Sub-Criteria
6	Address transport demand from the new town north of Waterbeach	i	Provides adequate road access to Waterbeach New Town
		ii	Provides improved rail access to Waterbeach New Town
		iii	Provides improved bus access to Waterbeach New Town
		iv	Provides improved active travel access to Waterbeach New Town
		v	Minimises car mode share to/from Waterbeach New Town
7a	Enable development in the Cambridge Science Park to proceed	i	Provides adequate road access to Cambridge Science Park
		ii	Provides improved rail access to Cambridge Science Park
		iii	Provides improved bus access to Cambridge Science Park
		iv	Provides improved active travel access to Cambridge Science Park

ID	Main Criteria	ID	Sub-Criteria
7b	Enable development in the Cambridge North Fringe East to proceed	v	Minimises car mode share to/from Cambridge Science Park
		i	Provides adequate road access to Cambridge Northern Fringe East
		ii	Provides improved rail access to Cambridge Northern Fringe East
		iii	Provides improved bus access to Cambridge Northern Fringe East
		iv	Provides improved active travel access to Cambridge Northern Fringe East
		v	Minimises car mode share to/from Cambridge Northern Fringe East
1	Maintain traffic at or below 2011 traffic levels in Cambridge	i	Cordoned Traffic Flows to/from Cambridge City
2	Minimise vehicle mileage whilst providing for increased travel demand	i	Average journey times on the A10 Corridor
		ii	Total distance travelled across the whole network
		iii	Average delay across the whole network
3	Improve reliability, capacity and speed of alternative transport modes	i	Improved Bus Journey Time reliability
		ii	Improved Bus Capacity
		iii	Improved Train Reliability
		iv	Improved Train Capacity
		v	Improved Active Travel Efficiency
		vi	Improved Active Travel Capacity
4	Minimise potential impact on alternative "rat-runs" to the A10	i	Reduced rat running on Cottenham Road
		ii	Reduced rat running on Twenty Pence Road
		iii	Reduced rat running on Horningsea Road
		iv	Reduced rat running on Green End Landbeach
5	Intercept or substitute car trips with alternative transport modes	i	Car mode share across the whole network
-	Capital Cost of Delivery	i	Capital cost of delivery

Source: Mott MacDonald

### 2.8.2 Scoring of Packages

The scoring was undertaken using a predefined scale to determine the relative impact of each package. These varied from simplified "Yes/No/Neutral" answers with scores of 1 to -1 respectively to more varied scores such as "Significant/Slight Benefit, Neutral, Slight/Significant Disbenefit" scored from 2 to -2 respectively. The scoring criteria for the strategic and transport themes are outlined in Table 7; scores marked as "N/A" were not used for appraising particular sub-criteria.

**Table 7: INSET Appraisal Scoring Criteria**

Sub-Criteria	2	1	0	-1	-2
Provides adequate road access to	Large improvement in road access to	Small improvement in road access to	No change in road access to	Small reduction in road access to	Large reduction in road access to

Sub-Criteria	2	1	0	-1	-2
Waterbeach New Town	Waterbeach New Town	Waterbeach New Town	Waterbeach New Town	Waterbeach New Town	Waterbeach New Town
Provides improved rail access to Waterbeach New Town	Large improvement in rail access to Waterbeach New Town	Small improvement in rail access to Waterbeach New Town	No change in rail access to Waterbeach New Town	Small reduction in rail access to Waterbeach New Town	Large reduction in rail access to Waterbeach New Town
Provides improved bus access to Waterbeach New Town	Large improvement in bus access to Waterbeach New Town	Small improvement in bus access to Waterbeach New Town	No change in bus access to Waterbeach New Town	Small reduction in bus access to Waterbeach New Town	Large reduction in bus access to Waterbeach New Town
Provides improved active travel access to Waterbeach New Town	Large improvement in active travel to Waterbeach New Town	Small improvement in active travel to Waterbeach New Town	No change in active travel to Waterbeach New Town	Small reduction in active travel to Waterbeach New Town	Large reduction in active travel to Waterbeach New Town
Minimises car mode share to/from Waterbeach New Town	Large improvement in mode share to Waterbeach New Town	Small improvement in mode share to Waterbeach New Town	No change in mode share to Waterbeach New Town	Small reduction in mode share to Waterbeach New Town	Large reduction in mode share to Waterbeach New Town
Provides adequate road access to Cambridge Science Park	Large improvement in road access to Cambridge Science Park	Small improvement in road access to Cambridge Science Park	No change in road access to Cambridge Science Park	Small reduction in road access to Cambridge Science Park	Large reduction in road access to Cambridge Science Park
Provides improved rail access to Cambridge Science Park	Large improvement in rail access to Cambridge Science Park	Small improvement in rail access to Cambridge Science Park	No change in rail access to Cambridge Science Park	Small reduction in rail access to Cambridge Science Park	Large reduction in rail access to Cambridge Science Park
Provides improved bus access to Cambridge Science Park	Large improvement in bus access to Cambridge Science Park	Small improvement in bus access to Cambridge Science Park	No change in bus access to Cambridge Science Park	Small reduction in bus access to Cambridge Science Park	Large reduction in bus access to Cambridge Science Park
Provides improved active travel access to Cambridge Science Park	Large improvement in active travel to Cambridge Science Park	Small improvement in active travel to Cambridge Science Park	No change in active travel to Cambridge Science Park	Small reduction in active travel to Cambridge Science Park	Large reduction in active travel to Cambridge Science Park
Minimises car mode share to/from Cambridge Science Park	Large improvement in mode share to Cambridge Science Park	Small improvement in mode share to Cambridge Science Park	No change in mode share to Cambridge Science Park	Small reduction in mode share to Cambridge Science Park	Large reduction in mode share to Cambridge Science Park
Provides adequate road access to Cambridge Northern Fringe East	Large improvement in road access to Cambridge Northern Fringe East	Small improvement in road access to Cambridge Northern Fringe East	No change in road access to Cambridge Northern Fringe East	Small reduction in road access to Cambridge Northern Fringe East	Large reduction in road access to Cambridge Northern Fringe East
Provides improved rail access to Cambridge Northern Fringe East	Large improvement in rail access to Cambridge Northern Fringe East	Small improvement in rail access to Cambridge Northern Fringe East	No change in rail access to Cambridge Northern Fringe East	Small reduction in rail access to Cambridge Northern Fringe East	Large reduction in rail access to Cambridge Northern Fringe East
Provides improved bus access to Cambridge Northern Fringe East	Large improvement in bus access to Cambridge Northern Fringe East	Small improvement in bus access to Cambridge Northern Fringe East	No change in bus access to Cambridge Northern Fringe East	Small reduction in bus access to Cambridge Northern Fringe East	Large reduction in bus access to Cambridge Northern Fringe East
Provides improved active travel access to Cambridge Northern Fringe East	Large improvement in active travel to Cambridge Northern Fringe East	Small improvement in active travel to Cambridge Northern Fringe East	No change in active travel to Cambridge Northern Fringe East	Small reduction in active travel to Cambridge Northern Fringe East	Large reduction in active travel to Cambridge Northern Fringe East

Sub-Criteria	2	1	0	-1	-2
Minimises car mode share to/from Cambridge Northern Fringe East	Large improvement in mode share to Cambridge Northern Fringe East	Small improvement in mode share to Cambridge Northern Fringe East	No change in mode share to Cambridge Northern Fringe East	Small reduction in mode share to Cambridge Northern Fringe East	Large reduction in mode share to Cambridge Northern Fringe East
Cordoned Traffic Flows to/from Cambridge City	Traffic levels are below 2011 totals	No change in traffic levels	N/A	Traffic levels increase in line with national forecasts	Traffic levels in excess of national forecasts
Average journey times on the A10 Corridor	Greater than 5-minute decrease in journey times	Up to 5-minute decrease in journey times	No change in journey times	Up to 5-minute increase in journey times	Greater than 5-minute increase in journey times
Total distance travelled across the whole network	Significant decrease in total trip distance	Slight decrease in total trip distance	No change in total trip distance	Slight increase in total trip distance	Significant increase in total trip distance
Average delay across the whole network	Significant decrease in average delay	Slight decrease in average delay	No change in average delay	Slight increase in average delay	Significant increase in average delay
Improved Bus Journey Time reliability	Bus journey times improved by more than 5 minutes	Bus journey times improved by up to 5 minutes	Bus service reliability does not change	Bus journey times decrease by up to 5 minutes	Bus journey times decrease by over 5 minutes
Improved Bus Capacity	N/A	Bus service capacity is improved	Bus service capacity does not change	Bus service capacity is compromised	N/A
Improved Train Reliability	Train journey times improved by more than 5 minutes	Train journey times improved by up to 5 minutes	Train service reliability does not change	Train journey times decrease by up to 5 minutes	Train journey times decrease by over 5 minutes
Improved Train Capacity	N/A	Train service capacity is improved	Train service capacity does not change	Train service capacity is compromised	N/A
Improved Active Travel Efficiency	Active Travel journey times improved by more than 5 minutes	Active Travel journey times improved by up to 5 minutes	Active Travel service reliability does not change	Active Travel journey times decrease by up to 5 minutes	Active Travel journey times decrease by over 5 minutes
Improved Active Travel Capacity	N/A	Active Travel capacity is improved	Active Travel capacity does not change	Active Travel capacity is compromised	N/A
Reduced rat running on Cottenham Road	Significant decrease in rat running	Slight decrease in rat running	No change in rat running	Slight increase in rat running	Significant increase in rat running
Reduced rat running on Twenty Pence Road	Significant decrease in rat running	Slight decrease in rat running	No change in rat running	Slight increase in rat running	Significant increase in rat running
Reduced rat running on Horningsea Road	Significant decrease in rat running	Slight decrease in rat running	No change in rat running	Slight increase in rat running	Significant increase in rat running
Reduced rat running on Green End Landbeach	Significant decrease in rat running	Slight decrease in rat running	No change in rat running	Slight increase in rat running	Significant increase in rat running
Car mode share across the whole network	Significant modal shift away from private car	Slight modal shift away from private car	No change in modal splits	Slight modal shift towards private car	Significant modal shift towards private car

Source: Mott MacDonald

Scoring for the cost theme was undertaken using a scale of -1 (least costly package) to -5 (most costly package) as a means to offset the benefits generated from scoring in the strategic and transport themes.

The full scores from the appraisal are summarised in Table 8.

**Table 8: Summary of Sub-Criteria Scoring**

ID	Sub-Criteria	Mode-Shift	Junction +	North Dual	South Dual	Full Dual	Rationale
6i	Provides adequate road access to Waterbeach New Town	0	0	1	1	1	Journey time savings to site are > 1 minute in dualling options
6ii	Provides improved rail access to Waterbeach New Town	2	2	2	2	2	All scenarios deliver significant journey time savings by train to the site
6iii	Provides improved bus access to Waterbeach New Town	1	1	1	2	2	South/Full Dual deliver >5 minute journey times savings for bus trips
6iv	Provides improved active travel access to Waterbeach New Town	0	0	0	0	0	All active travel journey time savings are < 1 minute
6v	Minimises car mode share to/from Waterbeach New Town	1	1	1	1	-1	Car mode share decreases in all but the Full Dual, where it increases
7ai	Provides adequate road access to Cambridge Science Park	0	0	0	1	1	Journey time savings are > 1 minute for south/full dual options
7aii	Provides improved train access to Cambridge Science Park	1	1	1	1	1	All scenarios generate similar train journey time savings
7aiii	Provides improved bus access to Cambridge Science Park	0	0	0	1	1	Bus journey times are only improved by south/full dual
7aiv	Provides improved active travel access to Cambridge Science Park	0	0	0	0	0	All active travel journey time savings are < 1 minute
7av	Minimises car mode share to/from Cambridge Science Park	-1	-1	-1	-1	-1	All scenarios lead to an increase in car mode share from the site
7bi	Provides adequate road access to Cambridge Northern Fringe East	0	0	0	1	1	Journey time savings are > 1 minute for south/full dual options
7bii	Provides improved rail access to Cambridge Northern Fringe East	1	1	1	1	1	All scenarios generate similar train journey time savings

ID	Sub-Criteria	Mode-Shift	Junction +	North Dual	South Dual	Full Dual	Rationale
7biii	Provides improved bus access to Cambridge Northern Fringe East	0	0	0	0	0	All bus journey time savings are < 1 minute
7biv	Provides improved active travel access to Cambridge Northern Fringe East	0	0	0	0	0	All active travel journey time savings are < 1 minute
7bv	Minimises car mode share to/from Cambridge Northern Fringe East	-1	-1	-1	-1	-1	All scenarios lead to an increase in car mode share from the site
1i	Cordoned Traffic Counts to/from Cambridge City	-2	-2	-2	-2	-2	All scenarios record traffic levels into Cambridge >20% from 2011 levels
2i	Average journey times on the A10 Corridor	1	1	2	2	2	Dualling options generate >5 minute journey time savings for all modes
2ii	Total distance travelled across the whole network	-1	-1	-1	-1	-1	All options bring about a slight increase in total trip distances
2iii	Average delay across the whole network	0	2	2	2	2	All highway interventions are able to significantly reduce the level of delay on the network
3i	Improved Bus Journey Time reliability	1	1	1	2	2	Bus journey times along corridor improved >5 minutes for south and full dual options
3ii	Improved Bus Capacity	1	1	1	1	1	Bus capacity is improved across all options
3iii	Improved Train Reliability	2	2	2	2	2	Train journey times improved by over 5 minutes in all scenarios
3iv	Improved Train Capacity	1	1	1	1	1	Train capacity is improved across all options
3v	Improved Active Travel Efficiency	2	2	2	2	2	Active travel journey times are improved > 5 minutes along the corridor

ID	Sub-Criteria	Mode-Shift	Junction +	North Dual	South Dual	Full Dual	Rationale
3vi	Improved Active Travel Capacity	1	1	1	1	1	Active travel capacity is improved across all options
4i	Reduced rat running on Cottenham Road	1	1	1	2	2	South/Full dual option reduce demand by >100 pcus
4ii	Reduced rat running on Twenty Pence Road	1	1	2	2	2	All dualling options reduce demand by >100 pcus
4iii	Reduced rat running on Horningsea Road	1	2	1	2	2	Highway options benefitting the southern end of the corridor reduce demand by >100 pcus
4iv	Reduced rat running on Green End	-1	-2	-2	-2	-2	Highway interventions all add >100 pcus to road
5i	Car mode share across the whole network	1	-1	-1	-1	-1	Highway interventions generate a slight modal shift towards private car
-i	Capital cost of delivery	-1	-2	-4	-3	-5	Schemes ranked in order of cost

Source: Mott MacDonald

### 2.8.3 Weighting of Criteria

Scores were then weighted according to their perceived relative importance. These have been defined as follows:

- **Themes:** Each have been weighted evenly as 1 as strategic, transport and cost outcomes are all perceived to be of equal importance
- **Main Criteria:** Access into Waterbeach has been assigned a weighting of 2 as it directly affects the Ely to Cambridge Corridor more than the Cambridge Science Park or Cambridge North Fringe East. Similarly, improving the reliability of alternative transport modes and reducing rat runs have been given weightings of 2 compared to more car-based outcomes. Minimised vehicle mileage has been given a weighting of 3 to reflect its overall strategic importance
- **Sub-Criteria:** Non-car accessibility criteria have all been given weightings of 2 to reflect the importance of modal choice on the A10 corridor. Reductions in delay have similarly been weighted as 2 as this is seen as more important as changes in trip distance. Changes to journey times have been given a weighting of 3 given their importance in determining economic benefits for the scheme. The cost scores were given a weighting of 0.2 to normalise the scoring (from -1 to -5) in line with the other outputs

### 2.8.4 Weighted Scores

The weighted scores are presented in and are grouped by each theme.

**Table 9: Final INSET Scores**

Package	Strategic Theme	Transport Theme	Cost Theme	Total Score
Modal Shift	1.00	0.93	-0.20	<b>0.58</b>
Junction Plus	1.00	1.33	-0.40	<b>0.64</b>
North Dual	1.13	1.93	-0.80	<b>0.76</b>
South Dual	1.67	2.20	-0.60	<b>1.09</b>
Full Dual	1.40	2.20	-1.00	<b>0.87</b>

Source: Mott MacDonald

These show that the South Dual option scores the highest overall, given its strong scoring in both strategic and transport outcomes and its relative cost compared to the other dualling options.

Out of the non-dualling options, both the modal shift and junction plus options deliver modest strategic and transport benefits at relatively low cost. The Junctions Plus option performs slightly better given that its highway impacts are more beneficial, despite its slightly higher cost.

Overall the dualling options all score higher than the non-dualling options as they are able to unlock significant benefits from both a strategic perspective and from a highway perspective.

This indicates that benefits could be gained by first undertaking comparatively low-cost packages which are likely to have shorter implementation programmes as well as lower costs, together with effective measures to encourage mode shift. Higher cost packages which generate significant benefits could then be adopted subsequently in line with the scale and pace of development.

### 2.8.5 Development-related transport planning

The model-based analysis set out above makes clear that transport conditions in the Ely to Cambridge corridor will deteriorate through time, and that this will be exacerbated with further development, unless measures are introduced both to target travel demand (and particularly private highway travel demand) and also to enhance the capacity and effectiveness of the transport networks on which people travel.

Beyond this analysis, however, there is also the case that a key responsibility for securing positive transport outcomes for the county lies with the detailed planning of individual developments and managing demand to travel, particularly by private car, at source. Moreover, it is clear that major development cannot continue to be delivered with a 'business-as-usual' approach to transport planning which frequently does little to discourage the frequent use of private motor vehicles.

To avoid the problematic impacts described above in this document, development must in future seek very carefully to:

- minimise external vehicle trip generation through maximising trip internalisation;
- provide significantly lower levels of car parking than has traditionally been provided, particularly at employment locations;
- promote a site-wide approach to car parking management to reduce the need for significant increases in car parking provision; and
- promote the use of non-car modes through significant investment in supply-side measures and aggressive travel planning to encourage the required mode shift.

The development of major sites at CNFE, CSP, and Waterbeach, as well as sites to the north of the corridor at Ely and beyond therefore represent an opportunity to take a more proactive approach to planning which maximises the likelihood of sustainable future travel patterns.

The planning and transport authorities should also ensure that processes for monitoring, managing, and reviewing transport outcomes are implemented and secured by and from developers through the consenting process.

Acceptable and stretching highway 'trip budgets' should be identified for each site and permission for continued stages of development should be made contingent on the ability of the developers to demonstrate their sites are meeting these targets through effective promotion of non-car-mode take-up and site-based demand management.

This is particularly relevant for the CNFE and CSP sites, given the constraints on highway capacity at, and south of, the Milton Interchange, the need for parking restraint here, and the availability of non-car travel options.

## 3 Financial Case

The Financial Case concentrates on the costs of each transport intervention, and how these are expected to be profiled out over time. It also discusses how allowances for risk have been accounted for in the cost estimates.

### 3.1 Methodology

The financial cost estimates were developed in line with national standards and guidance for individual elements of each transport intervention package.

As detailed in Section 2.6, there are five options which have been identified through the initial analysis for a more detailed appraisal:

- Mode-shift (DS1) - Do Minimum highway network, but new measures to encourage mode shift
- Junction+ (DS2) - Mode-shift option measures, but with additional junction improvements to the Ely to Cambridge Corridor
- North-dual (DS3) - Junction+ option, but with the provision of a dual carriageway, on an alignment to be determined, from the Waterbeach development north access to Ely
- South-dual (DS4) - Junction+ option, but with the provision of a dual carriageway, on an alignment to be determined, from the Waterbeach development south access to the A14 at Milton
- Full-dual (DS5) - Junction+ option, but with the provision of a dual carriageway, on an alignment to be determined, from the A14 to Ely

The cost estimates for individual scheme components have been included in this section, which are then combined to provide overall costs for each proposed option.

### 3.2 Assumptions

The following assumptions and exclusions have been incorporated into the cost estimates:

- **General Assumptions:**
  - The estimate is based at 4Q17 (no inflation has been allowed for beyond this time)
  - Works can be carried out under half road closure wherever possible
  - Existing ground level approximately same as finished construction levels
  - The A10 is not a Highways England maintained asset therefore no allowances have been included for roadside technology signs for NRTS
  - All signage to be unlit
  - All street lighting for the (non-rail) dedicated public transport route, ped/cycle and junction improvements is at 20m intervals
  - New Waterbeach Park and Ride site allowance for 1,000 spaces as per the Waterbeach Transport Assessment document
  - The generic layout of the relocated railway station platform uses assumptions taken from the Waterbeach Transport Assessment which is considered a reasonable basis for estimates at the early stage in the process

- If existing lane configurations not clear then a minimum of 100m allowed on the approach to major junctions where the lane configuration changes
  - Roundabout inscribed circle diameter assumed as 30m unless existing roundabout is larger
  - Assume (non-rail) dedicated public transport route is through a greenfield site
  - Assume cycle/ped way is through a greenfield site
  - The crossing over the River Great Ouse will be widened, not demolished and rebuilt
  - Replacement of pedestrian bridge for Milton Park and Ride for the South and Full Dual Options
  - Site Compounds included in the prelims except for the Guided Busway which needs site compound for a batching plant
  - Where possible budget quotations have been used from specialist subcontractors
- **Exclusions:**
    - VAT
    - 3rd party compensation costs
    - Planning and approval charges
    - Costs associated with Statutory Fees (e.g. HMRI, Local Authority, etc.)
    - Costs associated with taxes, levies and licences
    - Costs associated with changes in legislation and any form of applicable standards
    - Christmas, Easter and Bank Holiday working
    - Environmental mitigation works
    - Archaeological digs
    - Inflation beyond the base date
    - Land deemed relatively flat - minimising the use of safety barrier in the verges allowed for 50% barrier
    - Re-location of affected businesses
    - Road diversions
    - Landscaping
    - Retaining walls
    - Footpaths for the full length of the dual carriageway
    - Any works to the existing A14
    - Tactile paving
    - Procurement of new vehicles for the (non-rail) dedicated public transport route
    - New depot for vehicles for the (non-rail) dedicated public transport route

It is common practice when schemes and measures are in the early stages of their assessment for there to be a number of exclusions such as those noted above. For the purposes of assessing the economic performance of the packages (see the Economic Case), however, factors reflecting optimism bias, risk and other elements including an assumed uplift for land costs have been applied.

### 3.3 Capital Costs

#### 3.3.1 Baseline Costs

Baseline costs have been developed for individual components of each package of interventions. At this early stage of scheme development, these have been defined as follows:

- **All options**
  - New Station at Waterbeach (including car park)
  - Waterbeach Park and Ride site
  - Pedestrian and Cycle upgrades
  - Provision of dedicated (non-rail) public transport corridor
  - Localised measures on Milton Road in vicinity of CNFE and Science Park
- **Highway Intervention options (Junctions Plus, North Dual, South Dual, Full Dual)**
  - Highway Works (scaled according to level of intervention)

Costs for each component were profiled out according to the following items:

- **Construction:** Cost of building and contracting the scheme itself
- **Preliminaries (Prelim):** Cost of administering construction, assumed as 23% of construction estimate
- **Overheads & Profit (OH&P):** Business costs associated with construction, assumed to be 10% of construction + preliminary costs
- **Design:** Costs associated with the planning and design phases prior to construction, assumed to be 10% of overall Construction, Prelims and OH&P costs
- **Project Management (PM):** Costs associated with administering the design process, assumed to be 11% of overall Construction, Prelims and OH&P costs

These are presented in Table 10 alongside the scheme options and their components.

**Table 10: Baseline Intervention Costs (£000s, 2017 costs & prices)**

Cost Item	All Options (DS1 – DS5)					DS2 Junction Plus	DS3 North Dual	DS4 South Dual	DS5 Full Dual
	W'beach New Station	W'beach P&R	Ped & Cycle	Public transport corridor	Milton Rd local measures				
Const	7,500	3,500	5,200	21,900	1,100	18,700	67,700	39,800	91,300
Prelim	1,800	800	1,200	5,000	200	4,300	15,600	9,100	21,000
OH&P	900	400	600	2,700	100	2,300	8,300	4,900	11,200
Design	1,500	700	1,100	4,500	200	3,800	13,800	8,100	18,500
PM	1,100	500	800	3,300	200	2,800	10,100	5,900	13,600
<b>TOTAL</b>	<b>12,800</b>	<b>5,900</b>	<b>8,800</b>	<b>37,400</b>	<b>1,800</b>	<b>31,900</b>	<b>115,500</b>	<b>67,800</b>	<b>155,600</b>

Source: Mott MacDonald

#### 3.3.2 Risk Allowances

At this stage in the option development process, a degree of risk has been factored into the cost estimates, given the level of uncertainty associated with each package of interventions.

Several risk items have been identified as follows:

- **Risk Allocation:** Set at 10% of baseline costs – this will be updated based on a Quantified Risk Cost Allocation (QRCA) as the scope of interventions becomes more defined

- **Legal Fees:** Set at 2% of baseline costs
- **Business Case Fees (BC):** Assumed to be 3% of baseline costs
- **Land Costs:** Potential costs associated with purchasing up land for to each scheme in order to progress development, discounting any land required for construction compounds. At this stage this is assumed to be 20% of baseline costs, minus the preliminaries associated with construction compound setup but this will need to be subject to detailed review as the interventions are refined
- **Utilities Diversions (Utils):** Assumed to be 1% of baseline costs

These allocations are summarised in Table 11 alongside each option

**Table 11: Risk Allocation Costs (£000s, 2017 costs & prices)**

Cost Item	All Options (DS1 – DS5)					DS2	DS3	DS4	DS5
	W'beach New Station	W'beach P&R	Ped & Cycle	Public transport corridor	Milton Rd local measures	Junction Plus	North Dual	South Dual	Full Dual
Risk	3,200	1,400	2,200	9,300	400	8,000	28,900	17,000	38,900
Legal	300	100	200	800	50	600	2,300	1,400	3,100
BC	400	200	300	1,100	100	1,000	3,500	2,000	4,700
Land	800	400	500	2,300	100	1,900	7,000	4,100	9,400
Utils	100	100	100	500	50	400	1,400	800	1,900
<b>TOTAL</b>	<b>4,800</b>	<b>2,200</b>	<b>3,300</b>	<b>14,000</b>	<b>700</b>	<b>11,900</b>	<b>43,100</b>	<b>25,300</b>	<b>58,000</b>

Source: Mott MacDonald

Additional optimism bias uplifts have been added to these costs for the purposes of the economic appraisal, as discussed in Section 4.1.

### 3.3.3 Point Estimate

The total cost for each package of measures combines the baseline costs with the risk allowances for each scheme component. These are summarised in Table 12.

**Table 12: Point Estimates – Scheme Components (£000s, 2017 costs & prices)**

Cost Item	All Options (DS1 – DS5)					DS2	DS3	DS4	DS5
	W'beach New Station	W'beach P&R	Ped & Cycle	Public transport corridor	Milton Rd local measures	Junction Plus	North Dual	South Dual	Full Dual
Baseline Cost	12,800	5,900	8,800	37,400	1,800	31,900	115,500	67,800	155,600
Risk Allowances	4,800	2,200	3,300	14,000	700	11,900	43,100	25,300	58,000
Point Estimate	<b>17,500</b>	<b>8,100</b>	<b>12,100</b>	<b>51,200</b>	<b>2,500</b>	<b>43,800</b>	<b>158,500</b>	<b>93,100</b>	<b>213,700</b>

Source: Mott MacDonald

These individual component costs have been combined into intervention package costs for each option, as listed in Table 13.

**Table 13: Point Estimates – Transport Options (£000s, 2017 costs & prices)**

Cost Item	DS1 (W'beach New Station, W'beach P&R, Ped & Cycle, dedicated public transport corridor, Milton Road local measures)	DS2 (DS1 + Junction Plus)	DS3 (DS1 + North Dual)	DS4 (DS1 + South Dual)	DS5 (DS1 + Full Dual)
Baseline Cost	66,500	98,500	182,000	134,400	222,200
Risk Allowances	24,800	36,700	68,000	50,200	82,900
<b>Point Estimate</b>	<b>91,400</b>	<b>135,200</b>	<b>250,000</b>	<b>184,600</b>	<b>305,100</b>

Source: Mott MacDonald

### 3.4 Operational Costs

At this stage, operational costs have not been estimated as the scope of any changes to the maintenance regime or public transport services have not been fully defined.

### 3.5 Cost Profile

For the purposes of the economic assessment, it has been assumed that the total cost of each intervention package will be profiled out evenly across a four-year period leading up to an assumed package opening year of 2031. In practice, delivery of individual elements would be phased with some potentially delivered significantly earlier than others. However, for the purposes of this initial assessment, this has been used as a working assumption and to allow for a like-for-like comparison across the scenarios.

The cost profiles will therefore need be examined in additional detail once the transport interventions, and their delivery timescales, have been scoped out further.

## 4 Economic Case

The economic case for each package will be demonstrated by an analysis of all its impacts and their associated value for money. DfT guidance on undertaking a SOBC requires that only initial findings on the associated value for money of a scheme are provided at this stage.

### 4.1 Methodology

As detailed in Section 2.6, there are five do-something options which have been identified through the initial analysis for a more detailed appraisal. These all include improvements to public transport and encouraging a mode shift away from private vehicles.

In order to undertake economic assessment, a 'do minimum' case is also required for comparison purposes. The options appraised were:

- Do Minimum (DM) – the existing transport network, amended to include committed schemes as agreed with the County Council, and with increased demand reflecting planned growth in jobs and population to 2031
- Mode-shift (DS1) - Do Minimum transport network, but new measures to encourage mode shift
- Junction+ (DS2) - Mode-shift option measures, but with additional junction improvements to the Ely to Cambridge Corridor
- North-dual (DS3) - Junction+ option, but with provision of a dual carriageway, on an alignment to be determined, between the proposed Waterbeach development access and Ely
- South-dual (DS4) - Junction+ option, but with provision of a dual carriageway, on an alignment to be determined, between the proposed Waterbeach development access and the A14 at Milton
- Full-dual (DS5) - Junction+ option, but with the provision of a dual carriageway, on an alignment to be determined, between the A14 and Ely

The assessment of the transport user benefits has been undertaken using the software TUBA, with inputs provided using the County Council's CSR2 SATURN-based strategic model.

### 4.2 Assumptions

This section provides a description of the assumptions used in order to undertake the economic appraisal. The approach has generally followed WebTAG criteria, but in certain cases a simplified approach has been used to reflect the early development of the interventions. The key assumptions of the economic assessment are:

- A 60-year appraisal period with a package opening year of 2031 (as noted previously, this will be refined should the packages be developed further, assuming that some elements would be delivered significantly earlier than others)
- Appraisal based on model forecast years of 2031 and 2041. Only 2031 models were available for this study and given that TUBA requires two modelled years in order to interpolate and extrapolate benefits across the 60-year appraisal period, the 2031 inputs have been repeated with a forecast year of 2041. This assumes that benefits generated by each scheme will remain fixed from 2031 to 2041. Whilst not considered unreasonable at

this early stage of the process, more detailed modelling and profiling of benefits will clearly be needed should package elements be taken forward.

- Three modelled hours including:
  - AM Peak Hour (08:00 – 09:00)
  - PM Peak Hour (17:00 – 18:00)
  - Average Inter-Peak Hour (10:00 – 16:00)
- Annualisation factors have been derived to enable modelled time periods to represent the full year. The annualisation factors used assume 253 working days in a year and also assume that the benefits generated in the AM peak hour will be repeated for each hour of the 3-hour period from 07:00 – 10:00. Similarly, the PM peak hour benefits will be repeated for each hour of the 3-hour period from 16:00 – 19:00 and the inter-peak hour will be repeated for each hour of the 6-hour period from 10:00 – 16:00.

Furthermore, the following assumptions have been used with particular consideration for scheme cost inputs:

- Optimism bias taken as 66%, taken from WebTAG A1.2, Table 8
- All costs have been assumed to be construction costs with no operation and maintenance costs included, and a general uplift factor applied for land costs, which will require detailed review should the component schemes be taken forward
- A 4-year build period of 2028 to 2031 inclusive, with costs spread 25% across each year
- All costs calculated used a 2017 price base, these are converted to a 2010 price base for TUBA calculations with all TUBA output given in a 2010 price base.

### 4.3 Benefits Appraisal

In this section, a description of the benefits generated from travel time improvements and operating cost reductions for each option is presented, along with a commentary on the findings. Each of the five transport interventions have been compared against the “Do Minimum” option outlined in Section 2.7.

#### 4.3.1 Transport Economic Efficiency

The Transport Economic Efficiency (TEE) table provides a summary of the monetised journey time savings and operating cost savings generated by different user classes in each modelled scenario compared to the Do Minimum scenario. The outputs for all scenarios are summarised in Table 14.

**Table 14: Transport Economic Efficiency Summary (2010 values, discounted to 2010)**

Benefits Category	Benefits Sub-Category	DS1	DS2	DS3	DS4	DS5
		Value (£000)				
Consumer - Commuting user benefits	Travel Time	149,038	276,982	405,061	317,926	407,952
	Vehicle operating costs	20,500	19,804	21,199	7,050	6,608
	<i>NET CONSUMER - COMMUTING BENEFITS</i>	<i>169,538</i>	<i>296,786</i>	<i>426,260</i>	<i>324,976</i>	<i>414,560</i>
Consumer - Other user benefits	Travel Time	2,065	58,031	124,883	116,105	183,163
	Vehicle operating costs	1,473	3,866	-4,471	1,267	-9,340

Benefits Category	Benefits Sub-Category	DS1 Value (£000)	DS2 Value (£000)	DS3 Value (£000)	DS4 Value (£000)	DS5 Value (£000)
	<i>NET CONSUMER - OTHER BENEFITS</i>	3,539	61,897	120,412	117,372	173,823
Business – User benefits	Travel Time	32,776	66,940	139,684	79,762	138,986
	Vehicle operating costs	3,412	11,753	23,679	17,558	27,574
	<i>NET BUSINESS IMPACT</i>	36,188	78,693	163,363	97,320	166,560
<b>TOTAL</b>		<b>209,265</b>	<b>437,376</b>	<b>710,035</b>	<b>539,668</b>	<b>754,943</b>

Source: Mott MacDonald

The DS1 scenario offers significant travel time and VOC benefits to all trips. The net overall impact of the mode shift scenario generates approximately £210m benefits over the entire appraisal period when compared to the do-minimum.

DS2 consists of both mode shift package measures along with junction upgrades on the Ely to Cambridge corridor. These improvements result in an uplift in benefits when compared to the mode shift measures alone (DS1). This scenario also offers benefits to all trip purposes with the largest portion coming from commuter trips.

Providing a dual carriageway between Waterbeach and Ely (ie the northern section of the Ely to Cambridge corridor – alignment to be determined (DS3)) increases benefits further due to the increased capacity and speeds likely to be experienced as a result of the upgraded infrastructure.

Providing a dual carriageway between Waterbeach and the A14 (ie the southern section of the Ely to Cambridge corridor – alignment to be determined (DS4)) generates more modest benefits compared to the northern dualling, in part due to the shorter distance covered by the improvements.

Provision of a full dual carriageway from the A14 to Ely (the alignment would need to be determined through further detailed assessment work) offers the largest benefits.

#### 4.3.2 Analysis of Monetised Costs and Benefits (AMCB)

The AMCB table summarises the outcomes of the TEE calculations from Section 4.3.1, alongside an outline of greenhouse gas benefits and indirect taxes for each of the options. It also includes the cost components derived in Section 3, discounted to 2010 at 2010 prices. These are included in Table 15

**Table 15: Analysis of Monetised Costs and Benefits Summary (2010 prices discounted to 2010)**

Benefits/Costs Category	DS1 Value (£000)	DS2 Value (£000)	DS3 Value (£000)	DS4 Value (£000)	DS5 Value (£000)
Greenhouse Gases	976	2,473	155	329	-4,284
Economic Efficiency: Consumer Users (Commuting)	169,538	296,786	426,260	324,976	414,560

<b>Benefits/Costs Category</b>	<b>DS1 Value (£000)</b>	<b>DS2 Value (£000)</b>	<b>DS3 Value (£000)</b>	<b>DS4 Value (£000)</b>	<b>DS5 Value (£000)</b>
Economic Efficiency: Consumer Users (Other)	3,539	61,897	120,412	117,372	173,823
Economic Efficiency: Business Users and Providers	36,188	78,693	163,363	97,320	166,560
Wider Public Finances (Indirect Taxation Revenues)	-1,870	-4,435	229	-132	8,828
<b>Present Value of Benefits (PVB)</b>	<b>208,371</b>	<b>435,414</b>	<b>710,419</b>	<b>539,865</b>	<b>759,487</b>
<b>Present Value of Costs (PVC)</b>	<b>82,856</b>	<b>122,376</b>	<b>222,947</b>	<b>166,856</b>	<b>267,482</b>

As described in Section 4.3.1, the full dualling option offers an increase in benefits from both the north and south dualling options in isolation but at greater present value cost.

### 4.3.3 Safety Benefits

Due to the strategic nature of the options under consideration, the safety benefits have not been examined at this stage.

### 4.3.4 Environmental Benefits

Environmental benefits have been calculated based on the AMCB outputs above. These calculate the approximate monetised value of changes in greenhouse gas emissions between the Do Minimum scenario and each of the options.

The Junction + (DS2) option appears to generate the greatest greenhouse gas benefits, as it does little to change the speed and classification of the Ely to Cambridge corridor, but alleviates key areas of congestion which would have adversely affected emissions.

There are also modest greenhouse gas benefits for both the north (DS3) and south (DS4) dualling options, as the impact of congestion alleviation counter-balances the impact of increased speeds on the dualled parts of the route.

There are greenhouse gases disbenefits associated with the full dual option (DS5), which could be attributed to higher levels of traffic using the fully dualled route and travelling at higher speeds along the corridor, which outweighs the environmental benefits of any congestion alleviation.

### 4.3.5 Wider Economic Benefits

Wider Economic benefits have not been investigated at this stage due to the strategic nature of the interventions under consideration. Once the preferred options are refined, the impacts of the proposals on business, the economy and regeneration can be assessed as part of business case development for the recommended schemes

### 4.3.6 Reliability Benefits

The reliability benefits have not been quantified at this stage, although consideration was given to potential reliability impacts as part of the wider INSET appraisal outlined in Section 2.8.

### 4.3.7 Summary of Benefits

Each of the packages bring about monetised benefits in terms of journey time savings and reduced vehicle operating costs, particularly for commuting traffic on the Ely to Cambridge Corridor.

The level of benefit calculated for each intervention package at this stage suggests that the package including all of the public transport measures and provision of a full dual carriageway will generate the most benefits, followed by the package including the north dual proposal, then the package with the south dual proposal. The non-dualling options also generate benefits, with the junction improvement option providing more benefits than the mode shift option.

However, these benefits are counterbalanced by the relative costs of each scheme, with the packages that include the full dual and the north dual also being the costliest options, followed by the south dual, junction improvements and mode shift. The relationship between these costs and benefits are outlined further in the next section.

## 4.4 Value for Money

This section draws together the benefits calculations from the above section alongside the cost calculations from Section 3 to understand the net present value and benefit to cost ratios for each intervention package. These illustrate the value for money can be offered through each set of interventions.

### 4.4.1 Package Costs

The estimates in Table 16 have been calculated for each scenario, which incorporate the estimated costs of design, construction and risk allowances, but do not allow for the purchase of land or the ongoing operation and maintenance costs.

**Table 16: Package Cost Summary (£000, 2017 prices)**

Cost Item	DS1 (Mode Shift)	DS2 (Junction Plus)	DS3 (North Dual)	DS4 (South Dual)	DS5 (Full Dual)
Baseline Cost	66,500	98,500	182,000	134,400	222,200
Risk Allowances	24,800	36,700	68,000	50,200	82,900
Point Estimate	<b>91,400</b>	<b>135,200</b>	<b>250,000</b>	<b>184,600</b>	<b>305,100</b>

### 4.4.2 Risk and Optimism Bias

Risk allowances have been included in the prices outlined above, as detailed in Section 3.3.2. For the purposes of the economic appraisal, an additional 66% optimism bias has been added to the estimates to account for the level of uncertainty associated with the scope of the packages and the cost estimates themselves at this early stage of scheme development.

This is consistent with WebTAG Unit A1-2 on Scheme Costs, which states that early scheme development involving public transport components should apply a 66% uplift.

**Table 17: Package Cost Summary (£000, 2017 prices)**

<b>Cost Item</b>	<b>DS1 (Mode Shift)</b>	<b>DS2 (Junction Plus)</b>	<b>DS3 (North Dual)</b>	<b>DS4 (South Dual)</b>	<b>DS5 (Full Dual)</b>
Point Estimate	91,400	135,200	250,000	184,600	305,100
Optimism Bias (66%)	60,300	89,300	164,900	121,800	201,500
<b>Total Scheme Estimate</b>	<b>151,700</b>	<b>224,500</b>	<b>414,900</b>	<b>306,400</b>	<b>506,600</b>

#### 4.4.3 Present Value of Costs

As described in Section 3, assumptions have been made regarding the years in which the schemes will be built and therefore the years in which costs will be incurred. It is assumed that all schemes will be built and operational in the year 2031 and, for the purposes of this high-level initial appraisal, that each package will be built in the three years prior to 2031 then finished and opened that year.

TUBA uses a 2010 price base and therefore the costs given in Section 3 are converted to a 2010 price base using the GDP deflator and then discounted to the assumed build year at 3.5% per year until 2031 and 3.0% after. This results in the present value of costs (PVC) given in Table 18.

**Table 18: Application of package cost discounts (£000s)**

<b>Cost Item</b>	<b>DS1 (Mode Shift)</b>	<b>DS2 (Junction Plus)</b>	<b>DS3 (North Dual)</b>	<b>DS4 (South Dual)</b>	<b>DS5 (Full Dual)</b>
Package Estimate (2017 Prices)	151,700	224,500	414,900	306,400	506,600
Package Estimate (2010 Prices)	82,856	122,376	222,947	166,856	267,482

Source: Mott MacDonald

#### 4.4.4 Present Value of Benefits

Table 19 summarises the benefits described in Section 4.3. The table currently only displays the benefits generated through transport system efficiency improvements and currently does not take into account any safety, reliability or wider economic benefits that are likely to be generated by the packages.

This demonstrates that the full dual package (DS5) generates the highest level of benefits of around £760 million over the 60-year appraisal period, followed by the south dual package.

**Table 19: Present Value Benefits (£000s, 2010 prices discounted to 2010)**

<b>Benefits/Costs Category</b>	<b>DS1 Value (£000)</b>	<b>DS2 Value (£000)</b>	<b>DS3 Value (£000)</b>	<b>DS4 Value (£000)</b>	<b>DS5 Value (£000)</b>
<b>Present Value of Benefits (PVB)</b>	<b>208,371</b>	<b>435,414</b>	<b>710,419</b>	<b>539,865</b>	<b>759,487</b>

Source: Mott MacDonald

#### 4.4.5 Benefit to Cost Ratios

Following on from the processes outlined above, the present value of benefits (PVB) are offset against the present value of costs (PVC) for each of the intervention options. The absolute difference between both values is referred to as the net present value (NPV), whilst the ratio between the two is referred to as the benefit to cost ratio (BCR). The BCR is then used to determine the value for money offered by each intervention package. These figures are given in Table 48 below.

**Table 20: Benefit to Cost Ratios (£000s, 2010 prices discounted to 2010)**

<b>Benefits/Costs Category</b>	<b>DS1 Value (£000)</b>	<b>DS2 Value (£000)</b>	<b>DS3 Value (£000)</b>	<b>DS4 Value (£000)</b>	<b>DS5 Value (£000)</b>
<b>Present Value of Benefits (PVB)</b>	208,371	435,414	710,419	539,865	759,487
<b>Present Value of Costs (PVC)</b>	82,856	122,376	222,947	166,856	267,482
<b>Net Present Value (NPV)</b>	125,515	313,038	487,472	373,009	492,005
<b>Benefit to Cost Ratio (BCR)</b>	<b>2.515</b>	<b>3.558</b>	<b>3.186</b>	<b>3.236</b>	<b>2.839</b>

#### 4.4.6 Value for Money Statement

All intervention packages generate sufficient levels of benefits to offset the estimated cost of implementation.

The DfT's Value for Money Framework outlines different categorisations for schemes achieving BCR values within defined ranges. This classifies any schemes that score a BCR above 2 as demonstrating "High Value for Money". All packages tested here generate a BCR greater than this and, at this stage in the development process, are considered to demonstrate high value for money.

Based on the BCR scores, the package containing the southern dual scored highest out of the dualling options, followed by the packages including the north dual and then the full dual. The package including junction improvements and the mode shift proposals scores the highest BCR overall, whilst the mode shift package alone scores the lowest BCR overall. All packages have BCRs significantly in excess of 2 and therefore represent high value for money

This demonstrates that both lower-cost modal shift packages and higher cost highways packages have the potential to deliver significant benefits, although the greatest benefits have been derived from the packages which entail the provision of dual carriageway capacity to part or all of the A10 between Ely and Cambridge.

## 5 Commercial Case

The Commercial Case considers whether a transport investment is commercially viable and the potential procurement strategies that will be used to engage the market. It presents evidence on risk allocations and transfer, contract timescales and implementation timescales

### 5.1 Introduction

The main purpose of the Strategic Outline Business Case is to set out the need for intervention and define a preferred way forward. At SOBC stage, the Commercial Case is therefore typically presented as a high-level outline, which will be further developed as the scheme becomes more defined and the decision-making process reaches the Outline Business Case Stage.

### 5.2 Outline of Procurement Options

Different elements of the packages will likely be implemented using different routes depending on the type of scheme to be delivered and the lead authority be this the Combined Authority, the Greater Cambridge Partnership, or the County Council (possibly on behalf of the CA and / or the GCP). Some measures might also be implemented by third parties such as developers (potentially via Section 278 highways works), Network Rail, and others.

Further work by the authorities on the preferred procurement route for the different elements of the emerging preferred package will therefore be required but this could include:

- For large scale schemes (up to £20M), the Eastern Highways Alliance Framework
- For smaller scale schemes, the use of the County Council's Highway Services Contract
- Potential open invitation to tender (OJEU procurement) to select a contractor for the works from the open market
- Network Rail procurement mechanisms for rail-related works
- Developer-led works on the public highway via S278 Highways Act agreements
- Developer implementation of on-site works secured via planning condition

The advantages and disadvantages of these procurement routes, and their relevance to the different elements of the emerging preferred package will be considered in more detail as the different component schemes move through the Business Case process.

### 5.3 Programme Implications and Risk

An indicative timeline for delivery of a typical major scheme has been provided in the management case section to this report. However, more detailed programmes for each element of the emerging preferred package will need to be developed as these are progressed. This will need to include consideration of the following matters:

- Risk identification, allocation/transfer between commissioning authorities and contractor
- Timescales for procurement
- Contractor management strategy
- Payment mechanisms and arrangements should there be cost overruns

These issues will all be refined as the schemes move through the Business Case process, with full details being required at the Full Business Case stage.

## 6 Management Case

The management case demonstrates that the proposed packages are deliverable. It covers issues of the project planning and governance structure, risk management, communications and stakeholder management, benefits realisation and assurance.

### 6.1 Introduction

The Ely to Cambridge Transport Study has assessed a number of schemes, all of which require significant further development work and each with their own delivery mechanisms. At this early stage in the Business Case cycle, the management case is therefore high-level only. It is, however, considered important that programme-level oversight across the development and delivery of the whole package is retained and the recommended governance and management structures proposed in this section provide a start point for doing this.

### 6.2 Evidence of Similar Projects

Cambridgeshire County Council has successfully delivered a number of large-scale transport projects across the County in recent years. These include:

- **The Addenbrooke's Access Road** is a single carriageway route with several junctions and structures that connect Hauxton Road in Trumpington on the south side of the city, to Addenbrooke's Hospital. The route provides access to the expanding hospital and Bio Medical Campus, together with development on the Cambridge Southern Fringe, and reduces traffic in the Trumpington area, and on Long Road. The scheme was funded through a combination of Growth Area Fund and developer contributions, and was completed in October 2010
- **The Ely Southern Bypass** is a single carriageway highway, currently under construction, connecting the A142 at Angel Drove to Stuntney Causeway. The scheme include bridges over the railway line and the River Great Ouse and its floodplains and, when open to traffic will relieve heavy traffic around Ely station, remove the need for heavy goods vehicles to use the railway level crossing, and avoid an accident-prone low-bridge. The route will open to traffic in late summer 2018
- **The Cambridgeshire Guided Busway** provides a high quality public transport connection between Huntingdon and St Ives, to the north west of Cambridge, and Addenbrooke's Hospital and Trumpington Park and Ride to the south of Cambridge. Access to Cambridge City Centre is provided via on-street running. The overall route is 42km long with 25km of that being guided busway and 17km of on-street provision including bus priority measures. Construction began in March 2007 with the busway opened in August 2011. Although there were challenges during the delivery of the scheme, learning from this can benefit the delivery of future significant transport measures in the County.

### 6.3 Governance Arrangements

#### 6.3.1 Existing Governance and Management Arrangements

To date, the development of the proposed package of measures for the Ely to Cambridge corridor has been overseen by a two-tier structure as set out in Table 21 below.

**Table 21 Existing Project Management**

Body	Role	Composition
Project Board	Strategic oversight and direction	Cambridgeshire County Council (Chair) Cambridge City and South Cambridgeshire District Councils East Cambridgeshire District Council Cambridgeshire and Peterborough Combined Authority Greater Cambridge Partnership Greater Cambridge Greater Peterborough Local Enterprise Partnership Highways England University of Cambridge
Project Team	Day-to-day project management	Cambridgeshire County Council (Chair) Cambridge City and South Cambridgeshire District Councils Greater Cambridge Partnership

Source: CCC

Given the work to date has largely been technical in nature, engagement with decision-makers has largely been on a ‘for-information’ basis via briefing sessions with members of all of the directly impacted local authorities, GCP and CA members, and the local Member of Parliament.

### 6.3.2 Potential Future Governance and Management Arrangements

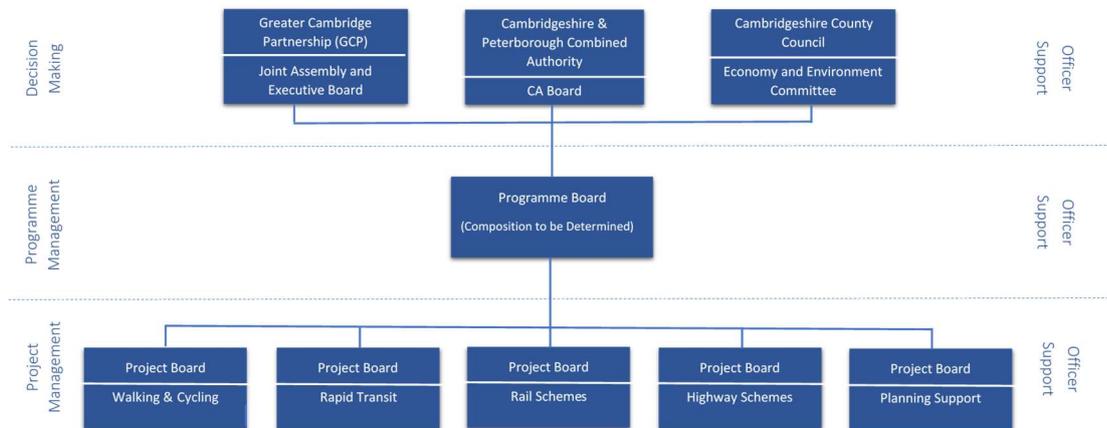

This initial phase of technical work has recommended a package of measures from walking and cycling improvements, through to larger-scale highway and dedicated public transport works.

The detailed governance and management arrangements for this package, should it be taken forward, will need to be developed in detail following approvals to proceed from the various decision-making bodies. However, the scale of the measures will invariably require strong project-level governance, with Project Boards and technical/administrative officer support for each element of the package, together with over-arching Programme Board oversight to manage the programme overall.

Given the complex transport funding and decision-making landscape in Cambridgeshire, and the variety of measures in the recommended package, strategic direction and approvals will likely need to be sought from all of the Combined Authority, the Greater Cambridge Partnership, and the County Council (depending on the element of the package being considered). The three bodies already work together on transport delivery so this could effectively be an extension to existing arrangements.

Figure 28 shows the potential governance arrangements. Clearly this may need to evolve as greater certainty emerges on the schemes, their funding, and the roles and responsibilities of the different bodies but this is considered to represent a sound initial basis for further development and agreement.

**Figure 28: Potential Future Governance Structure**

Source: CCC

## 6.4 Programme and Preliminary Indications of Delivery Timeline

The packages tested have a number of sub-elements. The programme for delivery of each of these, and their integration into a package-level programme, will need to be developed in detail as part of the next phase of the work depending on the recommendations and approvals from the various decision-making bodies.

The packages include a number of larger scale interventions including for dedicated public transport and increased highway capacity. Such interventions can have significant lead-times but an indicative traditional programme for their delivery, assuming approval to move towards major scheme business case development is given by September 2018, is shown in Figure 29.

This indicative programme will need significant development and refinement when agreement has been reached on the phasing of individual scheme delivery and as part of the development of scheme-level Business Cases when the scope to compress delivery timescales can be examined in detail.

**Figure 29: Indicative potential delivery programme for an individual major scheme in Ely to Cambridge Corridor based on traditional timelines and DfT guidelines**

### 6.5 Assurance, approvals and reporting

As shown in the indicative programme above, there are a number of key decision-making points at which a major scheme needs to be formally reviewed before it can proceed further.

These decision-making points include:

- Approval of the Outline Business Case;
- Approval of the Major Scheme Business Case; and
- Approval of the planning application (or other statutory processes depending on the nature of the scheme).

The exact assurance and approvals process to be followed will depend on the scheme itself (e.g. highways, rapid transit, other) and the type and source of funding that is used to deliver the scheme.

If a scheme is funded locally (i.e. the final decision to invest is taken by either the Combined Authority, and/or the Greater Cambridge Partnership), a detailed assurance and approvals plan for the scheme will need to be developed using the existing CA and GCP Assurance Frameworks. These describe the two bodies' processes for ensuring that investments provide value for money, based on best practice guidelines and require transport schemes to be appraised in line with the Department for Transport's (DfT) WebTAG guidance.

Given the devolved transport funding regime within Cambridgeshire, local funding is considered to be the most likely route. However, if funding from central Government were to be sought then any subsequent Outline Business Cases and Major Scheme Business Cases would need to be submitted directly to DfT, with scrutiny of the business case provided by DfT officials and the final investment decision taken by a Minister.

In addition to these formal decision-making points, the identified scheme sponsor will also undertake regular operational reviews. The operational reviews will form part of project monitoring meetings conducted every month by the relevant Project Manager and Senior Responsible Owner and will sit within the overall governance and management regime proposed in Figure 28 above.

The outcomes from the operational reviews will need to be reported to the relevant Project Board, potentially using a BRAG (Black, Red, Amber, Green) process with processes for remedy and escalation worked up in detail as overall governance arrangements for the projects are firmed up.

## **6.6 Communications and Stakeholder Engagement**

At present, the package for the Ely to Cambridge corridor scheme is still in the early stages of development. The stakeholders to be involved and the communication methods used to engage with them will therefore evolve as the package, and its constituent schemes, progress.

At Outline Business Case stage, a 'stakeholder mapping' exercise will be developed to understand the potential levels of interest in, and influence over, the package that various stakeholders have.

This will be used to develop a full Stakeholder Management and Communications Plan, which will include full details of who will be consulted, for what purpose, when, how and how often.

## **6.7 Risk Management Strategy**

The lead authorities will adopt a robust risk management strategy to ensure effective management of risk for the proposed programme of works. The partners (CPCA, GCP, and CCC) already have well established, proactive processes to managing of risk, therefore risk management plans will be implemented in accordance with those principles and with best practice. All risk registers will be reviewed regularly throughout the detailed design, procurement, construction and post-construction phase.

This well-established process has enabled the successful development and delivery of many transport projects within the County from smaller scale cycling and traffic management projects through to the larger scale projects set out in Section 6.2.

## 6.8 Monitoring and Evaluation

Scheme monitoring and evaluation for those measures taken forward from the emerging preferred package will follow established best practice procedures as set out by DfT and/or the local bodies. The delivery partners will agree clear objectives which will be documented within each scheme level (and potentially at programme level) monitoring and evaluation plan.

A logic map linking project inputs to outputs, outcomes and impacts will establish data requirements. The required baseline data, and the proposed methodology for monitoring impact/outcomes will all be established prior to formal project commencement. It is proposed that the level of reporting of the monitoring and evaluation plan will be at appropriate intervals, and will provide data to assess the success of each project in meeting the agreed objectives.

## 7 Summary and Conclusions

Following a review of the transport options and their cost and delivery implications, this section proposes a recommended approach for implementing a transport strategy on the Ely to Cambridge Corridor and the next steps for progressing the business case.

### 7.1 Recommended Strategy

The findings of this report have demonstrated that:

- The Ely to Cambridge Corridor is currently affected by congestion and connectivity issues
- Model analysis shows that travel demand will increase further on the Ely to Cambridge Corridor
- Significant additional developments are also planned around the Ely to Cambridge Corridor
- This will exacerbate issues on the corridor, leading to deterioration of economic opportunities, the environment and the wider transport offer

A joined-up strategy is therefore required that seeks to introduce both demand and supply-side measures along the corridor that cater to all modes and ensure that potential issues are mitigated. The strategy has been divided into 3 stages;

1. Policy, Planning and Regulation
2. Delivery of multi-modal “quick wins”
3. Longer term major highway interventions

These are described further in the sections below.

#### 7.1.1 Policy, Planning and Regulation

Securing funding for the transport strategy on the Ely to Cambridge corridor will form a core element of the delivery process.

Model-based analysis suggests that transport conditions in the Ely to Cambridge corridor will deteriorate through time, and that this will be exacerbated with further development, unless both demand and supply-side measures are introduced.

Therefore, mechanisms should be put in place to secure developer funding to deliver, or substantially contribute towards demand management and non-car infrastructure to ensure that adverse transport impacts are mitigated.

A demand management approach should be adopted for development and applied to planning applications for proposals in, and impacting, the corridor, whereby development should:

- Minimise external vehicular trip generation through maximising trip internalisation
- Provide significantly lower levels of car parking than has traditionally been provided, particularly at employment locations
- Promote a site-wide approach to car parking management to reduce the need for significant increases in car parking provision
- Promote the use of non-car modes through appropriate investment in supply-side measures and aggressive travel planning to encourage the required mode shift

The planning and transport authorities should also ensure that processes for monitoring, managing, and reviewing transport outcomes are implemented and secured by and from developers through the consenting process.

Acceptable and stretching highway 'trip budgets' should be identified for each site and permission for continued stages of development should be made contingent on the ability of the developers to demonstrate their sites are meeting these targets through effective promotion of non-car-mode take-up and site-based demand management.

Developers might be able to accelerate the phasing of their sites should they be able to demonstrate that their sites are hitting targets for car trips and are not exceeding an agreed budget. This would encourage effective promotion of non-car-mode take-up to free up more "headroom" for further development.

Developers should propose an approach to this for agreement with the planning and transport authorities.

Residual development-related highway impacts will need to be addressed through either direct delivery of schemes by developers, or through appropriate developer contributions based on proportionate impact to the proposed strategic highway and non-highway interventions.

### **7.1.2 Delivery of Multi-Modal "Quick Wins"**

The recommended strategy requires sequential delivery of "quick wins" – comprising both non-car based service/infrastructure enhancements and active parking restraint to promote mode shift and a sequence of prioritised on and off line localised carriageway improvements to create capacity for additional trips and manage potential re-assignment of trips onto less suitable routes.

The recommended non-private car strategy is for early implementation of the cycle measures, a relocated railway station at Waterbeach and early progression of the segregated public transport corridor from Waterbeach to Cambridge's Northern Fringe, together with park and ride provision at the New Town. Implementation of the non-highway proposals alongside ambitious travel planning for new and existing communities in the corridor could create some headroom for early, moderate scale, development at Waterbeach and at CNFE/CSP. The details of this will need to be explored through detailed transport assessments accompanying any planning applications.

### **7.1.3 Wider Highways Interventions**

Model-based analysis shows that the above "quick wins" alone will not mitigate more significant development-related growth or substantially address existing or future congestion. Predicted uplifts in travel demand is forecast to lead to greater displacement of traffic onto less suitable parallel routes including the B1049 and the B1047 unless it can be managed effectively.

Therefore, following on from the multi-modal improvements, a series of localised carriageway improvements should be pursued in the short to medium-term to reduce the likelihood of any additional trips rerouting via less suitable routes.

Options for junction improvements and other localised highway capacity improvements should therefore be developed for early implementation. Targeted improvements at junctions along the A10 itself lead to some improvements in conditions and reduces traffic rerouting elsewhere. These improvements should be accompanied by measures to discourage use of less suitable parallel routes including the B1049 and B1047. The traffic modelling demonstrates that such improvements would also be high value for money in transport appraisal terms. However, the

details of these measures will need to be developed through further study work. It is expected that development will make a substantial contribution to funding / delivering these measures.

Beyond these investments, this study indicates that there could be significant additional transport benefits from providing increased carriageway capacity in the Ely to Cambridge corridor, and that this will be required to mitigate both longer-term background growth in travel demand and more significant proposals for development, particularly at Waterbeach.

The initial study work suggests that, subject to more detailed work including examining environmental and operational impacts further, provision of increased carriageway capacity would represent a high value for money investment. This might be in the corridor itself, or on an alternative corridor if such an alignment were shown to remove a significant proportion of longer distance/through-traffic from the A10, or potentially through improvements to both.

## 7.2 Next Steps

Key stages following on from the publication of this report are set out below, with a view to delivering the transport strategy as set out in the recommendations above:

1. Undertake a consultation exercise to seek the views of decision-makers, members of the public, and other stakeholders, on:
  - a. the proposed sequencing of transport measures proposed
  - b. the content of each package and responsibilities for delivery
  - c. the implications for phased growth along the corridor arising from the measures proposed and opportunities to increase the impact of such measures
  - d. progression of a strategic option assessment for dealing with longer distance/through-traffic on the network, and the interaction this has with local traffic demand, via the ongoing M11-A47 study.
2. Along with this consultation exercise, it is recommended that detailed options are developed for all of the key elements of each package, including examination of their impacts, and developing business cases for those investments. Detailed assessments of environmental, operational, wider economic impacts will form part of this stage of the appraisal, along with consultation with local people and other stakeholders
3. Additional feasibility work for the cycling schemes, and the public transport components, should be considered an early priority. Similarly, it is recommended that early, detailed, exploration of the highway proposals is also undertaken.
4. The Highway Authority and Local Planning Authorities should develop funding/delivery options for the delivery of transport and related infrastructure to be explored with developers and key stakeholders to provide certainty to a package of transport investments required to facilitate planned future growth in the corridor. The model-based analysis shows that, although existing transport demand and that associated with wider growth, creates pressures on the network, this is exacerbated by development. Development will therefore be required to deliver, or substantially fund, key non-highway elements of the recommended strategy. Residual development-related highway impacts will need to be addressed through either direct delivery of schemes by developers, or through appropriate developer contributions based on proportionate impact to the proposed strategic highway interventions.

# Agenda Item 10

**GREATER  
CAMBRIDGE  
PARTNERSHIP**

Growing and sharing prosperity

Delivering our City Deal

**Report to:** Greater Cambridge Partnership Executive Board

08 February 2018

**Lead officer:** Beth Durham – GCP Head of Communications

## **Our Big Conversation**

### **1. Purpose**

- 1.1. The report presents the interim findings from the Greater Cambridge Partnership's (GCP's) autumn 2017 public awareness and engagement programme 'Our Big Conversation' (OBC).
- 1.2. The exercise aimed to strengthen the evidence-base needed to inform the GCP's Future Investment Strategy (FIS) by generating public dialogue on the Greater Cambridge growth story, testing emerging GCP proposals with the public and undertaking a comprehensive travel survey to refresh 2011 census data.

### **2. Recommendation**

- 2.1. The Executive Board is asked to:
  - a) To welcome the broad level of public engagement in Our Big Conversation and
  - b) Note initial findings ahead of the final report published as a supplement to the Future Investment Strategy (FIS) reports in March 2018.

### **3. Officer comment on technical issues raised at Joint Assembly**

- 3.1. The Joint Assembly was very positive about the comprehensive nature of work undertaken in Our Big Conversation. They recognised the value of having a strong evidence base on which to draw on in the future. In addition, the Joint Assembly was keen to ensure the findings were widely shared so that it could inform a range of related work.

### **4. Key issues and considerations**

- 4.1. The GCP is in the process of developing a 10 year Future Investment Strategy (FIS), looking beyond the next 'gateway review' to focus on its long term vision for economic growth in order to align its future resources accordingly.
- 4.2. A period of focused stakeholder engagement, under the banner 'Our Big Conversation', was undertaken between September 25 and November 30 2017.

- 4.3. OBC was delivered via a multi-channel marketing communications campaign targeting key GCP stakeholders including residents of Cambridge and South Cambridgeshire, employers and commuters within Greater Cambridge, elected Councillors, private and public services employees, students and school children. A consolidated report, prepared by Cambridgeshire County Council's Research Group, can be found at **Appendix A**.
- 4.4. The campaign used three mechanisms for recording public feedback: a) Comments generated at OBC events, paper and online OBC survey (led by the GCP Communications and Engagement Team); b) A Computer Aided Telephone Interview (CATI) travel survey of a representative sample of 1,021 Cambridge and South Cambridgeshire residents, commissioned from industry experts Systra, full report found at **Appendix B**; and c) A wider, largely self-selecting public travel survey with 200 Computer Aided Personal Interviews (CAPI) carried out door-to-door and commissioned from Travel for Cambridgeshire. Evaluation on-going. The presentation given by Systra to the Joint Assembly in January 2018 is provided at **Appendix D**. This provides the headlines from the survey report.
- 4.5. Census data was used to seek a representative sample of residents in the Systra survey. In the case of the Travel for Cambridgeshire travel survey, consumer insight analysis software (Acorn) was used to identify, engage and seek feedback from traditionally seldom-heard groups, for example younger households with people at the early stages of their careers (people with a stake in the future) and also people from low income households (particularly where income limited transport or travel choices).
- 4.6. In all, 38 public events were held, primarily at high footfall venues including supermarkets, transport hubs, hospital concourses and a Cambridge United football match. This number includes five targeted business workshops, two elected Councillor briefings, and events targeting children and young people.
- 4.7. The exercise created wide public awareness, generated 10,160 responses in total including 1,020 individual comments, 484 OBC survey responses and 8,656 travel survey responses. A full campaign impact evaluation report can be found at **Appendix C**.
- 4.8. While evaluation of the full data set remains on-going, it is anticipated that themes and key findings will remain largely the same.

## 5. **Key findings**

### **General**

- 5.1 The engagement showed high levels of awareness of growth with 89.4% of OBC respondents 'aware' or 'very aware'.
- 5.2 Traffic congestion was ranked as the highest challenge or travel challenge at 64.6%, with associated issues of sufficient and reliable public transport (both 42%) while 67% of respondents said they were unhappy with their current housing situation; over 50% cited the cost of buying as a the key issue; 44% of Cambridge respondents also cited the cost of renting property.
- 5.3 In priority order, people said the following GCP investments would help them get on better in life: 1. Improved public transport (55.9%) 2. Access to housing (17.5%) 3. Smart technology solutions (8.9%) and 4. Linking training opportunities to employment (4.6%).

5.4 In general, people showed support for both immediate and long-term solutions to address these challenges. In the case of transport, there was a general acceptance that behaviour change is required alongside the introduction of new public transport infrastructure. Most of the comments received focused on the travel behaviour of particular groups and how this needed to change. In particular, people pressed for a switch out of cars and onto public transport.

### **Transport**

5.5 OBC survey results showed strong support for the developing GCP transport strategy with 85.3% 'supporting' or 'strongly supporting' improving public transport, followed by 83.3% for improving cycling and walking and 72.9% for reducing general traffic in the city.

5.6 The residents' travel survey showed an increase in car/van use for commuting since the 2011 census in both Cambridge (32% to 37%) and South Cambridgeshire (64% to 75%). However, there was clear potential and appetite for modal shift within this group with over half (56%) saying they would like to make more journeys without their car or van – bus, minibus, coach services and cycling are identified as the most likely alternatives.

5.7 Speed and reliability were the most common reasons for car/van drivers not using alternatives at present. Only 6% of those who currently make journeys by car/van said that none of the proposed initiatives would encourage them to shift mode.

5.8 The proportion of people commuting by bicycle has also shown an increase (30% to 39%) whilst commuting by foot shows a decreased (from 16% to 5%). 62.3% of OBC respondents said that a significant increase in access to safe cycle, walking and non-motorised pathways would benefit them.

5.9 The survey results showed some clear preferences for certain incentives to encourage modal shift. The top five incentives were:

1. Introducing new public transport routes;
2. Improving reliability of public transport services;
3. Making public transport cheaper;
4. Improving the frequency of services on public transport; and
5. Introducing free parking at Park & Ride sites.

5.10 There was a clear public view that that the key to encouraging modal shift is to increase the cost of car travel and decrease the cost/time taken for other modes (most noticeably bus travel).

5.11 A range of options for managing down general traffic in the city centre, coupled with the potential to raise on-going revenue to reinvest in an improved public transport network were presented. Of these, beyond exceptionally high support for improvements to public transport, there were higher levels of support from both residents and businesses for a dynamic or "intelligent" road charging system (applied according to levels of congestion) and for pollution charging than for a Workplace Parking Levy (p. 33 Systra).

### **Housing**

5.12 The vast majority of people now recognise the supply of affordable housing as the critical issue for the sub-region.

- 5.13 Respondents were concerned about the cost of housing in Cambridge and South Cambridgeshire. Some respondents commented that travelling from outside of Cambridge into the city every day was more affordable than living there (but increased pressure on the transport network). Others related how, even on above average incomes, they could not afford a home. Help to Buy schemes were mentioned and were not felt to make a home affordable.
- 5.14 Respondents felt there was not enough choice in housing. There were comments that houses in Cambridge centre were being sub-divided into flats. People were also concerned that the housing market was focused towards providing expensive property towards the centre of Cambridge and that this approach was changing the whole nature of the city centre.

#### **Skills**

- a. A relatively small proportion of OBC respondents expressed a need for help to access skills or employment (16%).
- b. For those who were seeking to access skills, the lack of courses available locally was an issue with people citing having to go to London to access some vocational courses.
- c. For those looking to alternate employment, they cited an imbalance in the local labour market with jobs in the hi-tech / Bio-tech sector (and other areas of growth) not matching their own skill set.

#### **Smart**

- d. Generally, people welcomed any technological solutions that would smooth the end-to-end journey – especially across different public transport services.
- e. Of specific smart solutions presented for feedback, the most popular investment was shown to be in improvements to ticketing in terms of use across different forms of transport and pricing discount structures that recognised current patterns of use. There was also support for improved accuracy of real-time transport information.
- f. At the same time, the challenge back was for GCP to broaden smart working to include ‘smart ideas’ and ‘smart design’ rather than simply focusing on new technology. People with disabilities that had an impact on their ability to travel wanted better (smarter) design of the public transport network. Others wanted public transport services to be better designed to match non 9-to-5 working patterns.

### **6. Next steps and milestones**

- 6.1 Work to analyse the complete data set for the Travel for Cambridgeshire survey is currently on-going. As a result, the final report will be published as a supplement to the Future Investment Strategy (FIS) report in March 2018.
- 6.2 The data from the Our Big Conversation activities will be made available on Cambridgeshire Insight Open data website <http://opendata.cambridgeshireinsight.org.uk/> as part of the GCP’s commitment to make open data more widely available. This data will start to be available as the anonymization of the data is completed. This involves collating supplied personal information such as age or exact postcode into broader age group categories and postcode sectors. Free-text comments will also be filtered for any personal information.

- 6.3. The intelligence and information from Our Big Conversation will also be used by each of the work-streams to inform the GCP’s Future Investment Strategy so that it aligns with the needs of people who live and work in the Greater Cambridge area. An example of this would be to champion the elements of design that people wanted to see within the delivery of schemes to enable better access for people with disabilities.
- 6.4. The large volume of both quantitative and qualitative data will be further interrogated as new schemes and projects are proposed. This is to make sure that as new schemes are proposed, the key findings will be considered as part of future development and decision making. An example of this will analysis of sub-groups within the Travel for Cambridgeshire work to clearly define the size of possible user groups (and consequently those likely to shift) for schemes.

**7.0 Implications**

**7.1. Financial and other resources**

The work was funded by Greater Cambridge Partnership through City Deal funding.

**7.2. Legal**

No significant legal implications have been identified at this stage.

**7.3. Staffing**

The work was undertaken by staff within the Greater Cambridge Partnership with consultants appointed to carry out both the CATI survey and the wider travel survey work.

**7.4. Risk management**

The strategic risk register is maintained for the Greater Cambridge Partnership.

**7.5. Equality and diversity**

Equality is considered throughout this report. There are no diversity implications in this report.

**7.6. Climate change and environmental**

The intelligence and information from Our Big Conversation will also be used by each of the work-streams to inform measures that have the potential to reduce congestion and improve air quality in the longer term through encouraging a shift towards sustainable transport modes.

**7.7. Consultation and communication**

This was a period of focused stakeholder engagement as part of a widespread and continued engagement and communication process.

# OUR BIG CONVERSATION – KEY FINDINGS

Summary report of the Greater Cambridge Partnership's public engagement and surveys September – November 2017

**CONTENTS**

2 Introduction

3 Methodology

4-5 Campaign Impact

6-7 Findings (theme 1): We are traffic!

8-9 Findings (theme 2): Rock, Paper, Scissors (Bike, Bus, Train)

10-11 Findings (theme 3): Cost and Benefits

12-13 Findings (theme 4): Ticket to Ride/Up all Night

14-15 Findings (theme 5): Love the Bus

16-17 Findings (theme 6): Love the Bicycle

18-19 Findings (theme 7): Access for all

20-21 Findings (theme 8): The Trouble with Housing

22-23 Findings (theme 9): Skills and Learning

24 Feedback – Stakeholder views

25 Further information

**Authors:**  
 Beth Durham, GCP Head of Communications  
 Michael Soper, Performance and Research Manager, Cambridgeshire County Council  
 Aaron Rowinski, Business Intelligence Analyst, Cambridgeshire County Council

**Your feedback: next steps**

*Your feedback from Our Big Conversation will be used to help shape priorities for our Future Investment Strategy. The strategy will outline our future plans for transport, housing, skills and Smart and is our plan to government about what the £400M would deliver between 2020-2030 to unlock growth should we secure the next rounds of funding. These future plans, informed by your feedback, are set to be discussed and agreed at public meetings in February and March.*

**Introduction**

‘Our Big Conversation’ in Autumn 2017 was a chance for the Greater Cambridge Partnership to talk and listen to your views on the Greater Cambridge growth story – the current challenges you face and your ideas for the future.

Cambridge and South Cambridgeshire together remains one of the fastest growing places in the UK, with Cambridge set to be the UK’s fastest growing city in 2018\*.

To remain competitive in a post-Brexit economy – whilst continuing to offer a good quality of life for our local communities – it is vital we invest now for our future success.

To ensure a dynamic and thriving economy, Greater Cambridge needs to maintain the right balance of jobs, housing and a well-connected transport network.

The Greater Cambridge Partnership, the local delivery body for a city-based growth deal with central Government, is in a unique position to make a real difference. With access to funding of more than £500 million, the Partnership has the drive and determination to accelerate growth in a way that means more people can benefit from it across a wider area, as well as playing a vital role in the UK economy overall.

Our Big Conversation generated more than 10,000 individual responses and comments including at 38 public events from community pop-ups at supermarkets, workplaces and transport hubs, to business workshops and Councillor briefings.

Your wide-ranging feedback will now be used by our decision-makers to inform how the Greater Cambridge Partnership prioritises and invests future funding to ensure long-term benefits for existing and future generations.

Thank you for taking the time to share your views with us.

Rachel Stopard

# METHODOLOGY

**Our Big Conversation was delivered as an integrated campaign between September 25 and November 20 2017\*.**

- Objectives:**
1. Generate a quantitative and qualitative evidence-base to help inform development of the Greater Cambridge Partnership’s Future Investment Strategy in 2018
  2. Raise public awareness of the Greater Cambridge growth story and the role of GCP in supporting this
  3. Generate dialogue and promote active involvement in the development of long-term solutions across the GCP work-streams of transport, housing, skills and Smart.
- The campaign also served to provide wider context-setting for early GCP schemes and forthcoming consultations in 2017/18.

- Quantitative and qualitative data**
- The campaign used three mechanisms for seeking and recording public feedback:
1. Our **Big Conversation** general dialogue, including individual comments, paper and online surveys, to capture views on challenges/potential solutions to growth, transport, housing, skills and technology (GCP Communications and Engagement Team) 484 survey responses/770 comments recorded.
  2. Targeted Computer Aided Telephone Interview (CATI) travel survey of a representative sample of 1,021 Cambridge and South Cambridgeshire residents (**Systra**).
  3. Self-selecting and targeted residents’ and commuter travel survey (**Travel for Cambridgeshire**). 7,635 survey responses/250 comments recorded.

\*Feedback from two additional public events at Cambridge Guildhall and Papworth Hospital, held on December 6 and 7 respectively, are incorporated into the results.

- Audience & Channels**
- The campaign targeted the following key audiences:
- Residents
  - Commuters
  - Students
  - Employers – Employees
  - Elected members
- Traditionally under-represented groups were targeted in the travel survey exercise to capture a broad and representative range of views from local residents.

# THEME 1 – WE ARE TRAFFIC!

People felt that as viable alternatives to the car were developed then there needed to be a focus on changing travel behaviours.

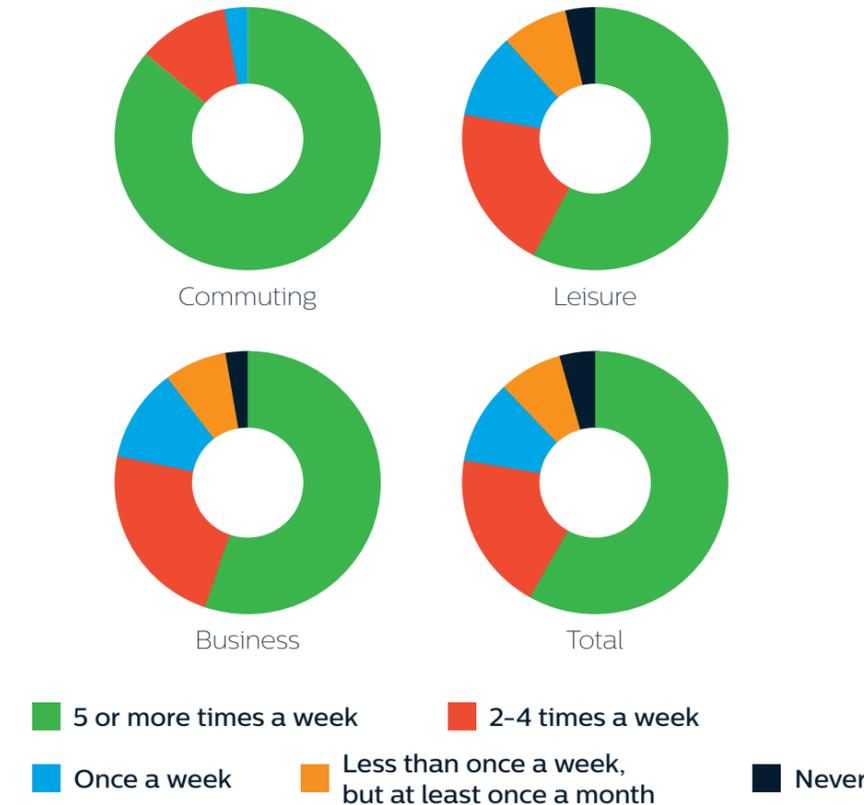

A significant number of those who took part in the Big Conversation acknowledged that traffic and congestion were a problem. The Systra Travel Survey identified that over 57% of people travel in and around Cambridge five or more times week and over 87% of people travelled around the area at least once a week; however, most people talked about the behaviour of others and how that needed to change rather than identifying what they could do differently. Respondents also identified significant cultural change as a result of the rate of growth.

What are the biggest challenges for you when travelling around the Cambridge area? Big Conversation 2017

# THEME 1 (DATA) – WE ARE TRAFFIC!

Frequency of journey by journey purpose – Systra

Results show a significant difference in frequency of travel by journey purpose: 86.5% of commuters travel in and around Cambridge five or more times a week, significantly higher than both leisure travellers (57.7%) and those who travel on business/personal business (55.5%).

Alternative modes

Respondents who indicated that they use a car/van to make journeys in and around Cambridge were subsequently asked if they could make these journeys using any other mode. Whilst nearly a third (31.9%) of these respondents stated that bus, minibus or coach services were available to them, two in five respondents (39.0%) said they had no other modes of transport they could use.

ALTERNATIVE MODES AVAILABLE	PERCENTAGE
Other bus, minibus or coach services	31.9%
Bicycle	25.0%
Park & Ride bus services	11.7%
Taxi	10.8%
Walking/Running	6.8%
Train	6.4%
Motorcycle/Moped/Scooter	1.8%
Other	0.1%
None of the above	39.0%
Don't Know/ prefer not to say	0.6%
<b>Base</b>	<b>681</b>

Commuters were more likely than those travelling for other purposes to say they could make their car/van journeys by bicycle (34.8% compared to 27.7% of leisure travellers and 22.9% of those travelling for business/personal business); and, less likely to say they could do so by bus, minibus or coach services (26.1% compared to 35.3% of leisure travellers and 32.4% of those travelling for business/personal business).

## THEME 2 – ROCK, PAPER, SCISSORS, (BIKE, BUS, TRAIN)

Residents didn't see any one form of transport as superior; rather they wanted to see an integrated network where people could move easily between different modes.

## THEME 2 (DATA) – ROCK, PAPER, SCISSORS, (BIKE, BUS, TRAIN)

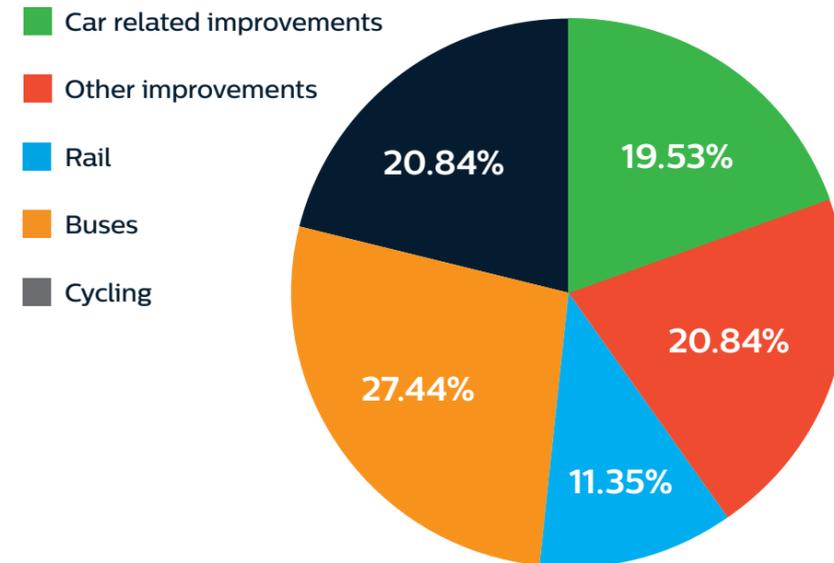

The majority of respondents to the qualitative question from the Big Conversation, "What would be the one thing that would improve travel in and around Greater Cambridge?", felt that their transport issues could be solved through some form of public transport improvements, either bus or train, or through improvements to the cycle network (59.63%).

Fewer respondents discussed cars or road-building in relation to solving transport problems (19.53%). According to the Systra survey, most residents travel alone by car/van (37.7%) followed by travel by bicycle (19.5%). There was notable differences between the primary mode of transport between Cambridge and South Cambridgeshire, with Cambridge more likely to use a bicycle (34.6% compared to 5.9%

in South Cambridgeshire) and South Cambridgeshire more likely to be the driver of a car/van (49.7% compared to 24.5% in Cambridge).

There is also a difference in perception of modes of transport for those with different working statuses. Those with higher incomes are more likely to use a car or rail and those with lower incomes are more likely to use a bus. The use of bicycles is similar across income brackets. For respondents there was a cost/benefit towards transportation use based on travel time and cost, which currently favours personal vehicle use.

Percentages of Qualitative Responses to Travel Improvements

*"A coherent, reliable, clean, low emission, aspirational, extensive, integrated public transport system combining rail, bus and rapid transit elements with cross ticketing. This needs to be subsidised to ensure sufficient rural coverage and low ticket prices by a work place parking levy or other road user charge."*

*"Get cars off the road especially in City Centre - improve Buses and trains to Cambridge not forgetting the smaller villages (even if you have smaller buses/mini buses that pick people up from villages and take them to the nearest Park & Rides it will dramatically reduce the number of cars, help people get to work / out and about. Villages always suffer with reduction in bus timetables and Villagers need these buses the most."*

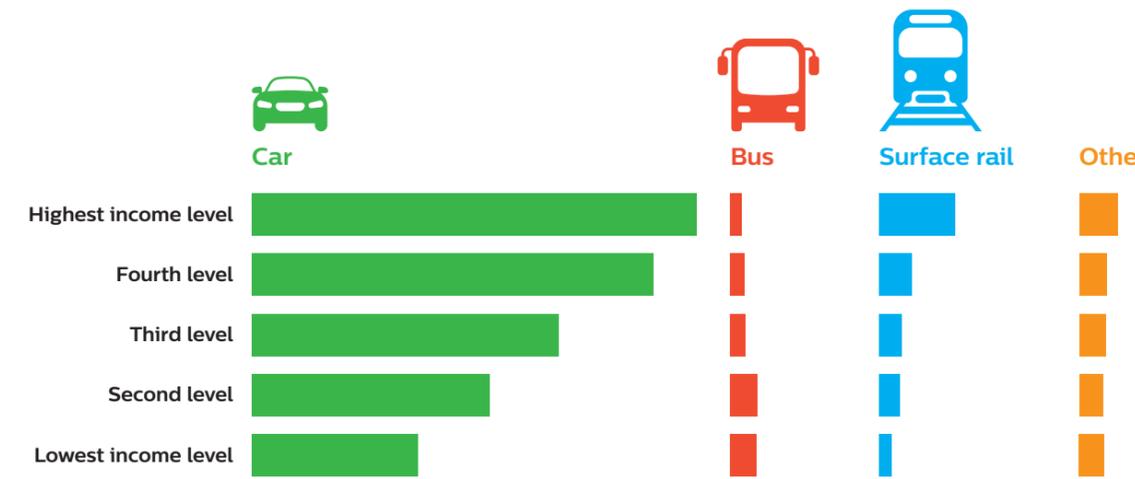

ALL MODES OF TRANSPORT	AB	C1C2	DE	ALL
Car/Van (as a driver, travelling alone)	58.6%	51.6%	40.0%	54.5%
Car/Van (as a driver, with passenger/s)	40.8%	42.9%	25.3%	40.1%
Bicycle	40.3%	27.2%	45.0%	36.1%
Other bus, minibus or coach services	23.5%	28.6%	27.4%	25.7%
Walking/Running	18.1%	21.4%	22.4%	19.7%
Park & Ride bus services	13.1%	10.8%	7.6%	11.8%
Taxi	5.1%	6.3%	11.3%	6.1%
Car/Van (as a passenger)	4.4%	6.3%	3.0%	4.9%
Train	6.0%	3.4%	1.1%	4.6%
Motorcycle/Moped/Scooter	2.2%	2.3%	0.0%	2.0%
Other	0.0%	0.3%	0.0%	0.1%
<b>Base</b>	<b>498</b>	<b>315</b>	<b>81</b>	<b>893</b>

**AB:** Higher & intermediate managerial, administrative, professional occupations.

**C1C2:** Supervisory, clerical & junior managerial, administrative, professional occupations or skilled manual occupations.

**DE:** Semi-skilled & unskilled manual occupations, unemployed and lowest grade occupations.

Table 4 from Systra survey

Average miles travelled, by household income quintile and mode: National Travel Survey, England, 2015 [NTS0705]

## THEME 3 – COSTS AND BENEFITS

When considering alternatives to car use residents ranked reliability the highest. Businesses were prepared to support more punitive measures to persuade people to switch if viable alternatives were in place first.

A major theme for respondents to the Big Conversation was the relative costs and benefits of different transport choices. People discussed how the Greater Cambridge Partnership can improve the benefits of using public transport, cycling and walking and also implement disincentives for car travel. Suggested measures were about bringing about behaviour

change as well as adding in new infrastructure.

Respondents on behalf of business were clear that they wanted to see investment in developing viable travel alternatives prior to disincentives being introduced such as a workplace parking levy.

### Improving Benefits

“Separation of cycling from motor traffic.”  
 “Segregated cycle infrastructure so that people of all ages feel safe cycling and choose it over the car.”  
 “Introduce free buses for transporting children to and from school, and ban parents from driving their children to within 500m of school unless they have mobility difficulties.”  
 “A coherent, reliable, clean, low emission, aspirational, extensive, integrated public transport system combining rail, bus and rapid transit elements with cross ticketing.”  
 “Get cars off the road especially in City Centre - improve Buses and trains to Cambridge.”  
 “Free Park and ride. Bring back the city centre shuttle bus. All public transport to be free and frequent.”  
 “Improving bus lanes to make it quicker than travelling by car. Currently with prices of park and ride and with busses often getting stuck in the same traffic cars are queuing it's understandable why people prefer to drive.”

### Increasing Costs

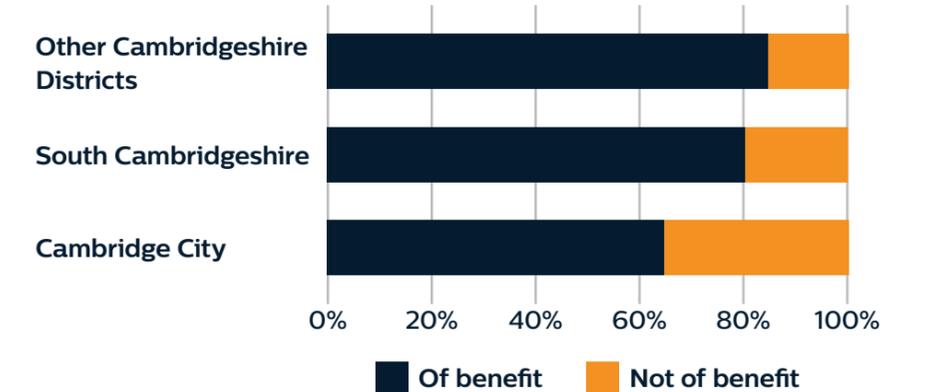

“Stop all motorised traffic from entering the Cambridge city centre.”  
 “Congestion charging under a cordon control system (charges on for entry to the city) using the tidal charge proposed some time ago would be a good possibility. However all the public transport alternatives need to be in place before you switch on the charge.”  
 “Business parking levy, which would provide revenue to invest in public transport improvements.”  
 “We need to change the mindset about vehicles, especially private cars.”  
 “Face up to it GCP - we need a road pricing system that reduces congestion and funds an effective, affordable bus service.”

## THEME 3 – COSTS AND BENEFITS

REASON FOR MODE CHOICE	PERCENTAGE
Reliability of journey	40.6%
Speed of journey	38.2%
Distance to destination	22.0%
Physical comfort	16.2%
Price of transport	16.0%
Health reasons	14.5%
Complexity of journey (e.g. number of connections)	13.7%
Frequency of service	11.1%
More environmentally friendly/ sustainable	9.1%
Work vehicle/ drive for job	6.2%
Price of parking	6.1%
Distance to station/ stop	6.1%
Availability of car parking	5.4%
Personal safety	4.9%
Availability of cycle facilities	3.1%
Ability to do other things while travelling (e.g. work/read/etc)	1.2%
Availability of 'Real Time Information'	0.3%
Availability of other forms of information	0.0%
Other	25.8%
Don't Know/ prefer not to say	0.6%
<b>Base</b>	<b>1001</b>

Looking at the results of the Travel Survey (Systra Autumn 2017) speed, reliability and comfort were placed above cost when considering transport choice for local journeys in and around Cambridge.

### Of benefit to travel needs: Improving public transport: by location

Over half of existing users of the St Ives to Cambridge Busway said that they would have made their journey by car (suggesting significant mode shift from car on to the service). As well as reliability and speed, cost was a factor in the decision to switch (Source: Systra, Survey of Existing Guided Bus Users, 2017). Below shows a basic comparison of both cost and journey time for Car versus Bus for the trip on the Bus Way from St Ives to Cambridge using a basic formula and tools available to internet users.

ST IVES TO CAMBRIDGE	
MEGA RIDER per month <b>£96</b>	Price per mile <b>£0.45</b>
Cost per year <b>£1,152.00</b>	Cost per year <b>£3,320.55</b>
Time (Google maps) <b>39 minutes</b>	Time (Google maps) <b>49 minutes</b>
	

# THEME 4 – TICKET TO RIDE / UP ALL NIGHT

People wanted a travel system that reflects their individual needs. There is a frustration that current services are built around the 9-5 and focus on just getting people to Cambridge centre.

# THEME 4 (DATA) TICKET TO RIDE / UP ALL NIGHT

## Theme 4a – Up all Night

Many respondents focused on how the public transport system did not match their work pattern so they had to rely on personal transport to get to and from work. Reference was made to the operating hours for Park and Ride services ending early evening so not being suitable for those who worked as part of the night-time service economy in Cambridge. Similarly services didn't support those working shifts at major employers such as Addenbrookes Hospital.

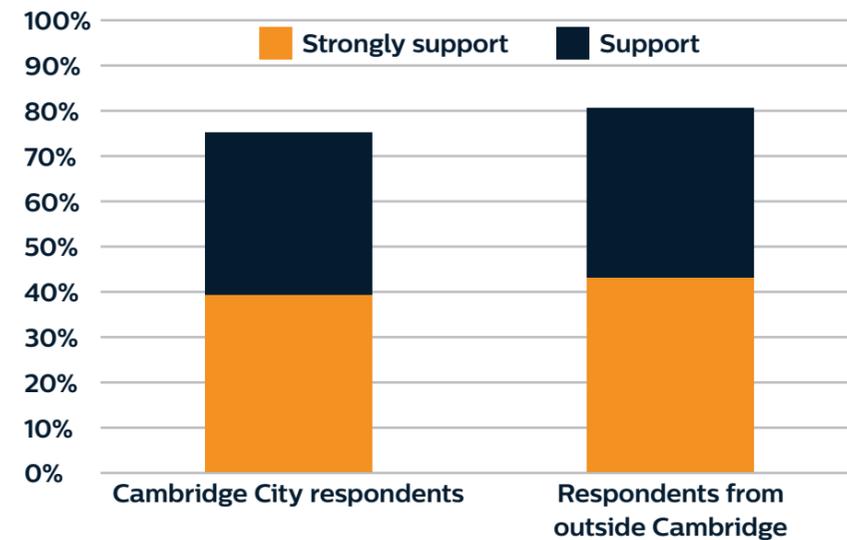

## Theme 4b – Ticket to Ride

Respondents also focused on how the ticketing on public transport in the Cambridge area worked. Discounts on ticket costs were felt to be

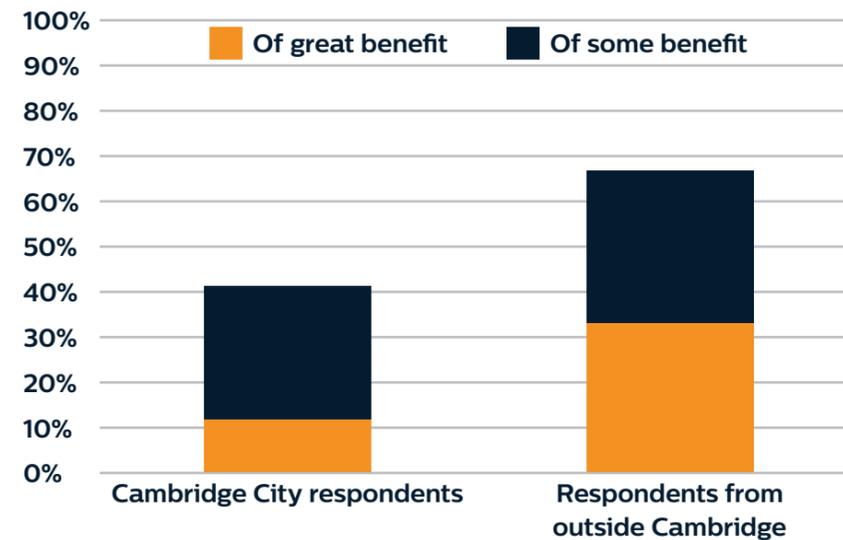

focused on those who commuted 5 days a week to the disadvantage of those worked from home some of the time or who worked part-time. There was strong demand for an 'Oyster' card style system where people could pay for their travel across different forms of public transport as well as demand for 'cross-ticketing' (the same ticket being valid for different types of public transport).

Across both themes people wanted a 'Smarter' design for the operation of the public transport system. This qualitative information provides very useful context to the contrast between people's support for the expansion of Park & Ride services (70% Strongly Support or Support) within the city compared to the proportion of people from outside Cambridge that say this would be of great benefit for them (33%).

How far do you support our strategy aims: Expand Park & Ride services, both in scale and use. Source: Big Conversation

Considering your travel needs, which of these would benefit you the most? To expand on Park & Ride services, both in scale and use. Source: Big Conversation

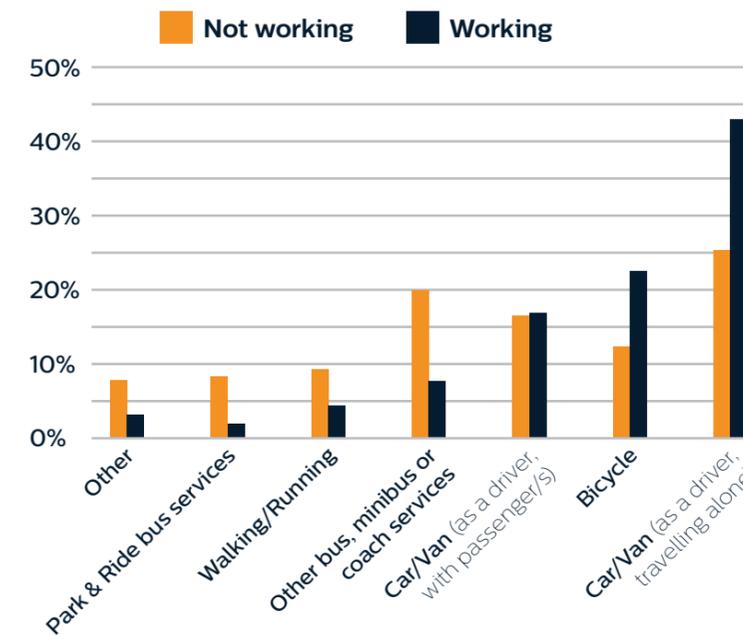

41% of people responding to the Systra survey said that longer operating hours would encourage them to switch to public transport.

The Systra survey also identifies interesting patterns of transport when comparing working status with non-working status. The use of more sustainable forms of transport (apart from the bicycle) is much more common amongst those who don't work (generally people aged 65+) compared to those who do.

Usual mode of transport by working status.

Source: Systra travel survey, Autumn 2017

## Transport infrastructure investment needs to reflect the difference in travel needs for different groups within the population...

- Regular commuter from outside Cambridge coming into the City 5 times a week at peak time
- Regular commuter from within Cambridge crossing the City 5 times a week at peak-time
- Shift worker, travelling into the City outside of peak travel time
- Older person making a leisure journey into or around Cambridge
- Parent on the school run from South Cambridgeshire into Cambridge City
- Other travel personas based upon data from the Big Conversation...

## THEME 5 – LOVE THE BUS

Overall 40% of people from Cambridge and 56% of people from South Cambridgeshire told us during the Big Conversation that 'significantly improving the public transport network in terms of availability, capacity, and reliability and, as far as possible, affordability' would be of great benefit to them.

When discussing bus transport people had a list of improvements that needed to be made to get them to transfer to bus transport or make use of buses more (as their main form of transport).

### Improvements to Park & Ride sites

"I travel into Cambridge every day. The issue is not public transport but road links to the public transport - P&R sites. This does not get enough attention."

"I spend 90 minutes every day commuting. I use the P&R at Madingley, but this has been built in the wrong location, with traffic from the A428 to the P&R site meaning the journey takes at least 30 minutes in the morning."

"I know that one cannot get into the city centre until about 10:30 by Park and Ride or local service bus because the traffic between my home and the Park & Ride site is frequently seriously clogged up."

### Removing Disincentives

"Our bus service (Girton to Cambridge) is unreliable, and the service has been reduced from 3 buses per hour to two, which is tiresome and inconvenient."

"The Park & Ride option is expensive and I object strongly to the decisions taken by the local authority to introduce a parking charge."

"We have a good bus route across town (the U) but journey times to station vary from 15-40 mins & impossible to plan."

### Connectivity of the Bus Network

"There is a lack of cross county buses. Nearly all buses terminate in Cambridge so you have to catch another bus if you want to travel to the other side from where you live."

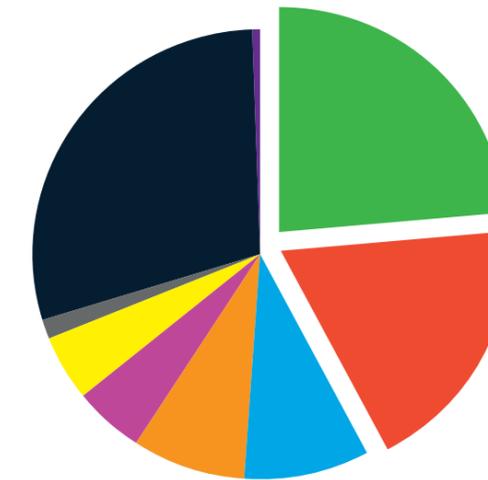

"I live in one of Cambridge's satellite villages where the only practical travel option is my car. It's too far to cycle in & out of Cambridge and public transport is not regular enough, run early enough in mornings or late enough in evenings/night."

"I live in a village with no effective public transport provision at all which is only 12 miles from Cambridge."

## THEME 5 (DATA) – LOVE THE BUS

### Self-reported alternative modes of transport available to car/van users.

Source: Systra travel survey, Autumn 2017

32% of car/van drivers say that existing buses do provide an alternative to their car use (note that people could choose more than one alternative).

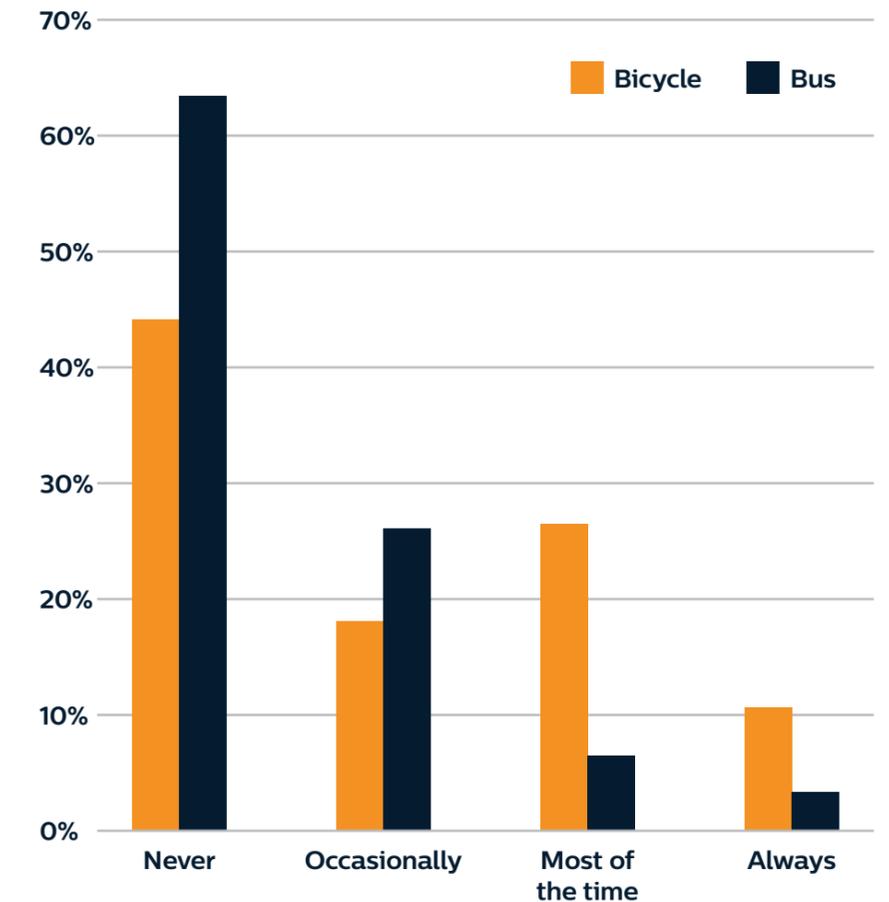

25% of car/van drivers say that cycling is an alternative to their car use (note that people could choose more than one alternative).

The data from Systra demonstrates that there is potential to grow the numbers of people using buses within the region with 32% of people usually using car/van saying that buses provide a viable alternative. In answer to this question a further 39% of people said that there wasn't currently any viable alternative to their car use. These people represent the target audience for the introduction of new public transport infrastructure.

### Mode of transport by frequency of use.

Source: Travel for Cambridgeshire Survey 2017

## THEME 6 – LOVE THE BICYCLE

Overall 72% of people from Cambridge and 48% of people told us during the Big Conversation that significantly increasing access to safe cycle, walking and non-motorised routes would be 'of great benefit' to them.

When discussing cycling people had many ideas to further improve the network...

### Segregation

"An extensive network of segregated cycle ways connecting most outlying villages/towns into Cambridge would greatly encourage more cycling and get people out of private cars."

"Extensive and continuous network of segregated cycling and walking infrastructure"

"Widen existing narrow cycle paths around the city, segregate pedestrians/cyclists/cars better"

"Proper segregated cycleways - not just little blue signs on existing footpaths or a metre wide strip of paint alongside busy, narrow roads"

### Park & Cycle

"Provide edge of Cambridge parking with bike storage (not village hubs which are too far out to cycle or walk from). Vast numbers of drivers would transfer to foot or bicycle with guarantees of travel times"

"Park and cycle sites"

"Park & Ride/cycle in right places with reliable buses both in and out"

### Wider Network

"Also keep improving cycling with clear routes marked well and make us feel safer and confident on where we can cycle and we will cycle more."

"I am looking forward to the Chisholm Trail and the new Chesterton cycle/pedestrian bridge, which I will use on a daily basis."

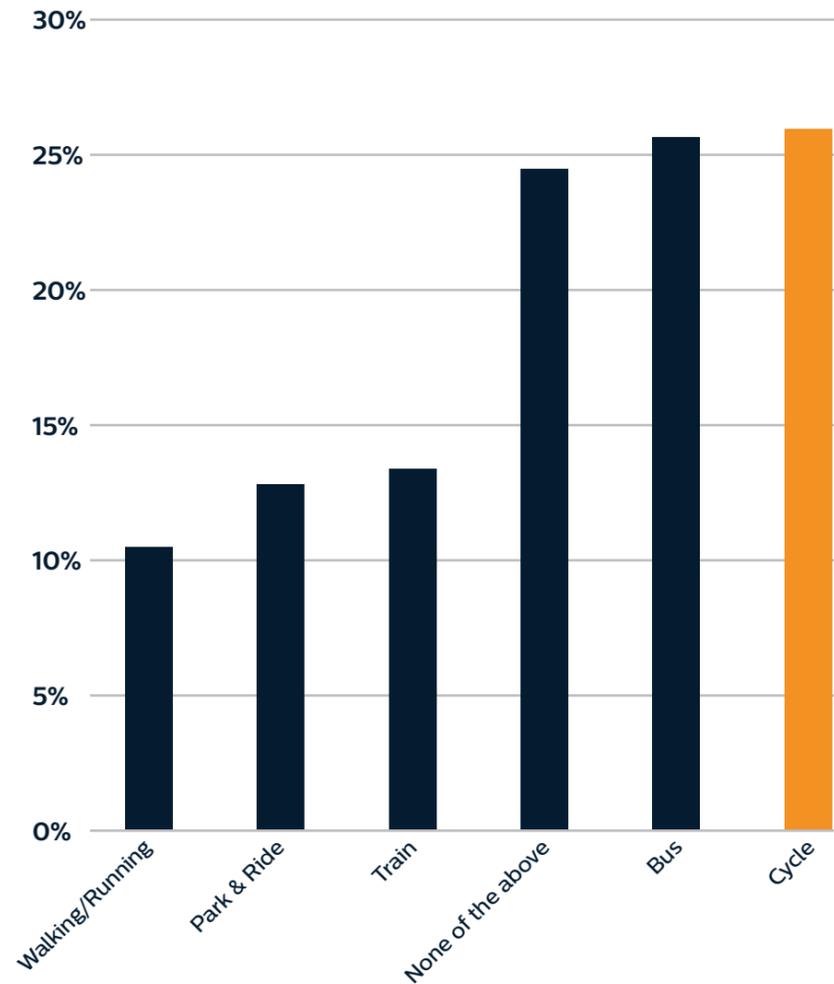

"To be able to support car-free living in Cambridge you need to properly cater for cyclists of all ages, including the use of cargo bikes."

"Expand cycle networks, widen existing narrow cycle paths around the city, segregate pedestrians/cyclists/cars better."

## THEME 6 (DATA) LOVE THE BICYCLE

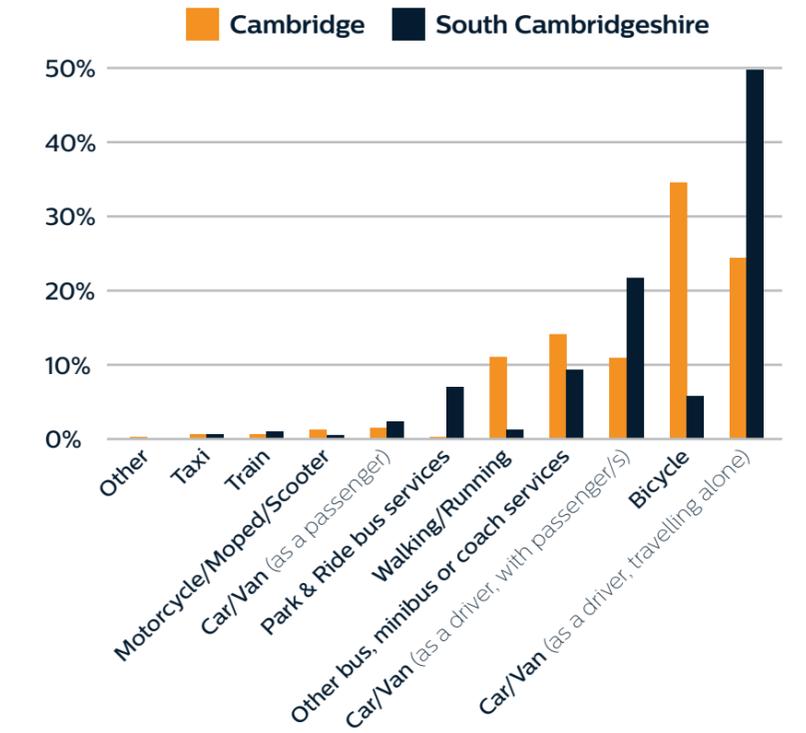

### Alternative modes of transport available instead of current car use.

Source: Travel for Cambridgeshire Survey, 2017 (people could select more than one option)

### Usual mode of transport used, by district.

Source: Systra travel survey, Autumn 2017

The data from Systra also demonstrates that there is further potential to grow the numbers of people cycling in the region with 25% of people usually using car / van saying that cycling is a viable alternative.

## THEME 7 – ACCESS FOR ALL

People with disabilities are more dependent on public transport. They needed better design within the public realm to support them to travel with ease.

Respondents with protected characteristics discussed the difficulties they had accessing travel methods, which in turn was causing issues in using leisure facilities and finding employment. For those with disabilities public transport options were felt to be difficult to get on to, were not available in suitable locations or reliable enough to use, and some commented on being denied access. Older respondents also iterated these points. There were comments on an overreliance on cycle improvements which some respondents felt was ignoring residents who were not physically able to make use of them.

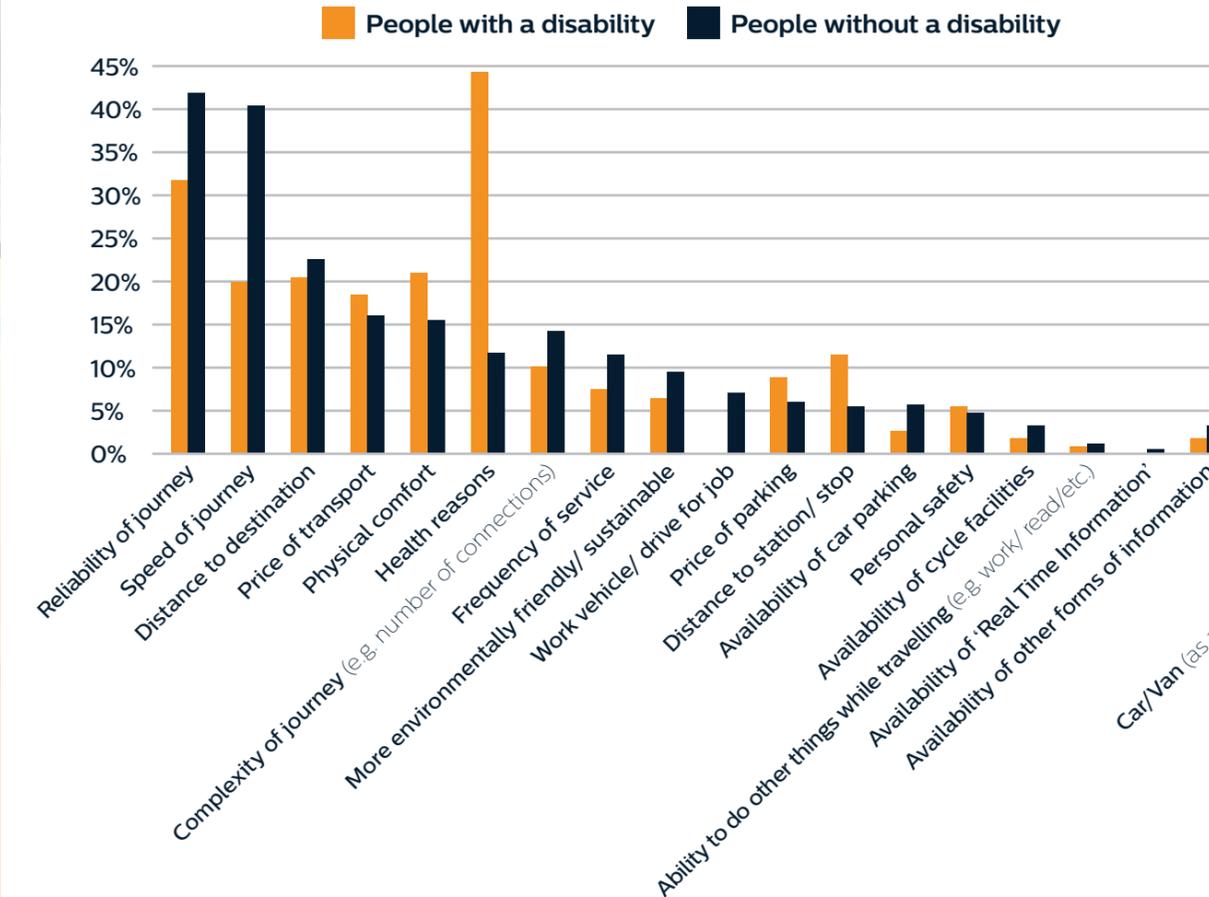

They also discussed how employment opportunities were not available to them. Some respondents felt their age or need for childcare options put them at a disadvantage in job applications and that training was not available to older residents.

Respondents also commented on their personal safety. For many who cycled there was the feeling of a need to improve on the safety of cycle facilities as they felt uncomfortable sharing the road with vehicles. Other respondents commented on the behaviours of cyclists and drivers, with pedestrians feeling unsafe at places such as crossings and on shared pathways.

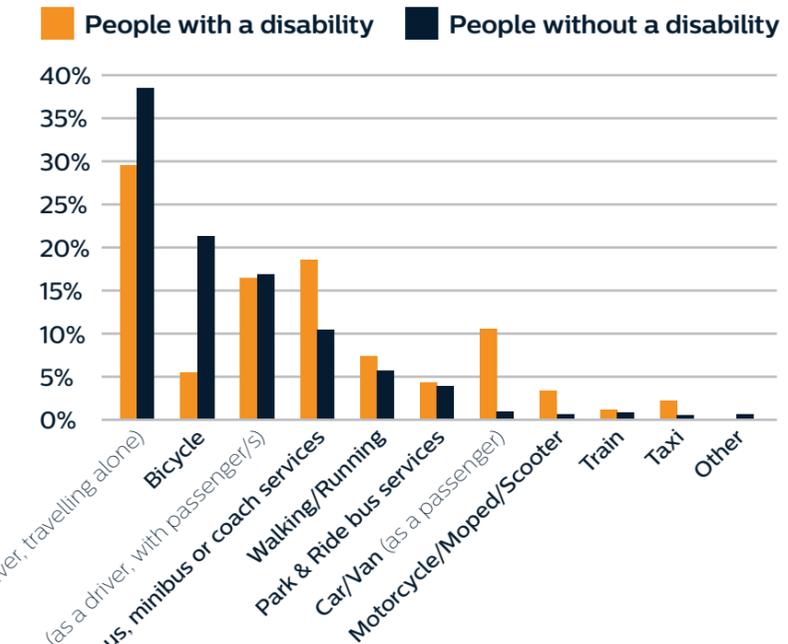

## THEME 7 (DATA) ACCESS FOR ALL

How reasons for travel choice differ for people with a disability (systra travel survey 2017)

How travel choices differ for people with a disability (systra travel survey 2017)

The research by Systra also shows that people with disabilities have a different set of priorities compared to those without disabilities. Travel choice is shaped by physical health, distance of stop/station from final destination as well as comfort. Price is also more important for those with a disability.

The research by Systra shows that people with disabilities have a different set of travel choices that need to be recognised when designing public transport. Investment in cycle schemes have little benefit to this group however they are almost twice as likely to use the bus compared to people without a disability.

“Need to consider elderly and disabled” - (Businesses meeting feedback)

“Preferably trams or more buses ideal something separated from general traffic and cycles that do not cycle in cycle lanes and happily cross on road.”

“Lack of flexibility of employers eg part-time working, some working from home. Ageism.”

“Wherever one goes in Cambridge one is aware that vehicles, especially private cars and delivery vans, pose a threat to one’s safety and to efficient bus services.”

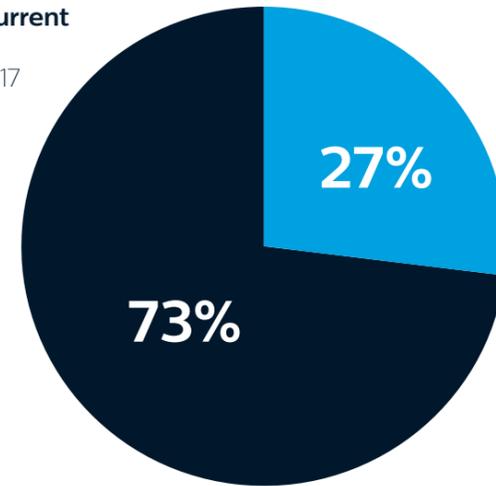

## THEME 8 - THE TROUBLE WITH HOUSING

Significant numbers of people were unhappy with their housing situation. The Cambridge area has relatively high rents and locally house prices have risen at a rate similar to London. People were concerned about the impact this was having on commuting.

Almost three quarters of the people we spoke to as part of the Big Conversation were unhappy with their current housing situation. The main problem was the cost of housing (either to buy or to rent) but people were also concerned about how the pattern of development at places like Northstowe and Cambourne may increase in-commuting by car to Cambridge. Within Cambridge there was concern that the style of new development towards the centre of the City was changing the social structure and nature of the area.

**Are you happy with your current housing situation?**  
Big Conversation Survey, 2017

Yes No

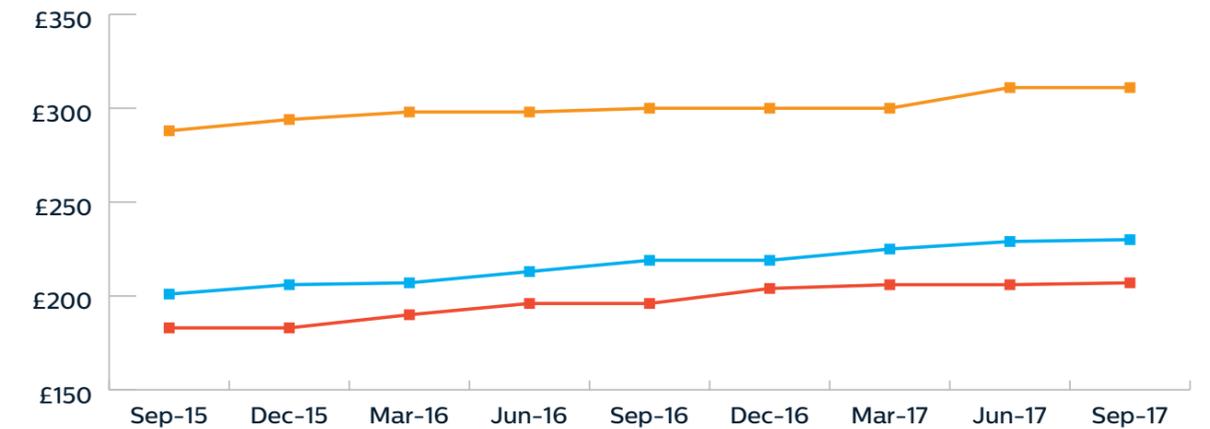

## THEME 8 (DATA) THE TROUBLE WITH HOUSING

According to Hometrack Cambridge house prices have grown at a similar rate to those in London. Since 2007 house prices in both Cambridge and the Capital are 60% higher. The lower quartile house price (reflecting the cheapest 25% of the housing market) shows that the price of entry level

property in Cambridge is currently averaging £338,000 (Sept 2017). In terms of affordability, this price represents a ratio 15.6 times the average person's salary for the area. Recent data shows that Cambridge has the highest income to price ratio outside of London.

UK

“Parish Councils or Local Authorities to build, own and manage properties for local people” - Councillor

“Think about facilities as well as just housing. How do we cope with no facilities such as shops, schools, doctors. Every initiative needs to be supported by infrastructure” – resident

“Housing is the key issue for travelling around Cambridge as everyone has to come in and out” - resident

“I want to relocate my warehouse nearer to Cambridge to avoid M11/A14 traffic but not sure where the most strategic location would be for freight and there is no suitable land or property to purchase” – business

## THEME 9 - SKILLS AND LEARNING (WE WANT TO LEARN AND GROW)

People acknowledged a difficulty in developing the right skill sets in order to take advantage of the developing Cambridge economy. Matching skills with available opportunities was key.

A total of 84 organisations were represented across five business briefings. A key issue for those organisations was the improvement needed in the recruitment and retention of staff. The problem was felt to be particularly acute in retaining recent graduates in the face of high housing costs and finding and retaining suitable candidates for apprenticeships.

Some employers talked about a 'wages gap' across different parts of the economy with high value jobs pushing up the rental / housing market making it harder to find staff to fill service or administrative positions. The role of the Greater Cambridge Partnership in creating the transport links that connect employers in the area with a larger labour market was acknowledged. With businesses commenting that the ease / cost of travel was an important factor in recruitment and retention.

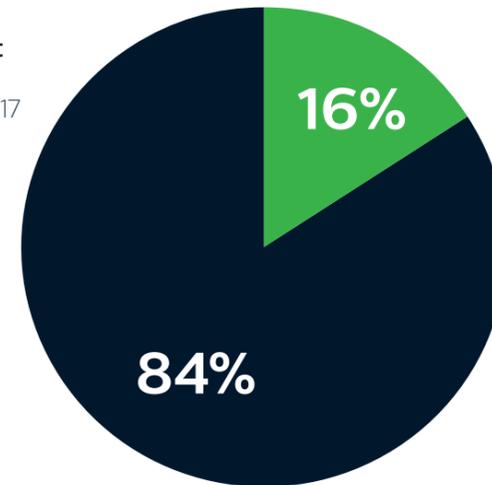

### The main survey findings were:

- When asked, 16% of survey respondents said that they were currently looking for new training or seeking new or different employment.
- Some talked about the pace as which the area was changing and the challenge of maintaining the right skill set.
- Acknowledgement that improving public transport would be an enabling factor when searching for employment.
- Access to some training was also identified as limiting with many providers being London based.

### Are you looking for access to training or new/different employment?

Big Conversation Survey, 2017

■ Yes ■ No

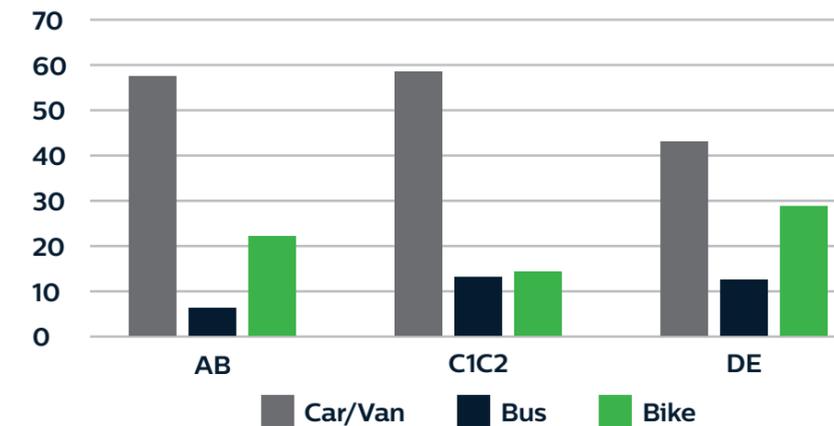

## THEME 9 (DATA) SKILLS AND LEARNING (WE WANT TO LEARN AND GROW)

### Understanding the role of transport in inclusive growth

Figure 1 shows the relationship between providing high quality transport (as well as housing and a high quality environment) and the labour market. Transport is seen 'as the most obvious factor' for building connectivity; linking potential workers with opportunities.

### Differences in 'Usual Transport' choice by social classSource: Residents Survey, Systra, 2017

Locally our data (statistically representative resident's survey, Systra, 2017) shows that the use of bus transport by social class DE is double that of social class AB. Social class DE is also the highest percentage 'usual' user of bikes. This underlines the importance of transport in supporting people into employment.

Practical examples of changes to transport policy in this regard from around the world include the rerouting of transit routes to link areas of relative poverty to employment, temporal changes to time-tables to

link people to shift-work or to evening employment and schemes that reduce the cost of transport (and interchange) for regular users.

A number of people commented on the mismatch of skills compared to jobs in the labour market. The Inclusive Growth Commission (RSA 2016) have identified the "hollowing out" of traditional mid-skill jobs with those in work losing skills in relation to demand in the labour market. The possible solution being a stronger focus on vocational and in-work training to support the continual development in skills.

“Recently I had to turn down training in Huntingdon (which started at 9am) as I would have had to catch 2 buses and walk and I probably wouldn't have been able to get there until about 9.30am or later.”

## EXECUTIVE SUMMARY

### Study Background

The Greater Cambridge Partnership (GCP) commissioned SYSTRA to undertake research with residents in Cambridge and South Cambridgeshire to better understand people's travel behaviour, and reasons for their travel choices, in and around Cambridge.

The GCP aims to develop a sustainable transport network for Greater Cambridge that keeps people, business and ideas connected as the population grows. The research study was developed to support the design of a transport framework to reduce congestion and encourage modal shift, and shape investment from 2020 onwards.

### Methodology

A total of 1,021 computer aided telephone interviews (CATI) were completed with residents across Cambridge and South Cambridgeshire between 25th September 2017 and 19th October 2017.

Landline and mobile phone numbers were compiled for households/people living in Cambridge and South Cambridgeshire from the Operator Services Information System (OSIS) and Random Digit Dial numbers matched to local area dialling codes. Telephone numbers were then dialled at random.

The first survey questions demographically profiled respondents. The final sample was weighted by district, gender and age to ensure it was representative of all residents living in Cambridge and South Cambridgeshire. A good sample was achieved and therefore weighting values were small.

### Survey Results

#### An opportunity for modal shift away from car/van

Overall, the data shows that there is both potential and appetite for modal shift among car/van drivers.

- Over two thirds (68%) of respondents said they use a car or van, at least sometimes, to travel in and around Cambridge (56% in Cambridge and 80% in South Cambridgeshire).
- Of these, over half (56%) said they would like to make more of these journeys without their car or van (57% in Cambridge and 56% in South Cambridgeshire).

Bus, minibus and coach services, and cycling, were the most likely alternative to car/van. Travelling by bicycle was more likely to be considered an alternative for those living in Cambridge than those living in South Cambridgeshire; while travelling by bus, minibus or coach service was more likely to be considered an alternative for those living in South Cambridgeshire than those in Cambridge.

The speed and reliability of alternative modes were the most common reasons for not using alternative modes at present. In addition, Cambridge residents considered the price of transport to be a barrier, while South Cambridgeshire residents considered distance to destination to be a barrier.

## Recent changes in transport modes

Respondents who stated that they made commuting journeys to/from work were asked to identify the mode of transport they usually use for these specific journeys. This question was also asked in the 2011 Census.

For residents in Cambridge and South Cambridgeshire, the proportion of people commuting to work by car/van is shown to have increased – being higher in this survey than in the 2011 Census. This increase is more dramatic in South Cambridgeshire, where the proportion has increased from 64% to 75%, than in Cambridge, where the proportion has increased from 32% to 37%.

Across both areas there also appears to have been a shift from the 2011 Census in the proportion of people commuting by bicycle and on foot, with the proportion commuting by bicycle increasing and the proportion commuting by foot decreasing. This pattern is more pronounced in Cambridge where commuting by bicycle has increased from 30% to 39%, and commuting by foot has decreased from 16% to 5%. In South Cambridgeshire, the proportion commuting by bicycle has increased from 8% to 11%, and commuting by foot has decreased from 7% to 2%.

## How to encourage modal shift

The survey results show some clear preferences for certain incentives to encourage modal shift. The top five incentives were:

- Introducing new public transport routes;
- Improving reliability of public transport services;
- Making public transport cheaper;
- Improving the frequency of services on public transport; and
- Introducing free parking at Park & Ride sites.

These results were very similar for residents of Cambridge and South Cambridgeshire, with the exception of introducing free parking at Park & Ride sites. Residents in South Cambridgeshire were much more likely than those in Cambridge to say free parking at Park & Ride sites would encourage them to change their travel behaviour (73% compared with 56%).

Only 6% of those who currently make journeys by car/van said that none of the proposed initiatives would encourage them to reduce their car/van use. Those living in South Cambridgeshire were more likely to say they could be encouraged to change, with only 4% saying none of the initiatives would encourage them to switch mode, compared to 8% of Cambridge residents.

## **1. INTRODUCTION**

### **1.1 Study Background**

- 1.1.1 The Greater Cambridge Partnership (GCP) commissioned SYSTRA to undertake research with residents in Cambridge and South Cambridgeshire to better understand people's travel behaviour and reasons for their travel choices.
- 1.1.2 The GCP aims to develop a sustainable transport network for Greater Cambridge that keeps people, business and ideas connected as the population grows; and makes the area easily accessible by sustainable travel modes, in terms of access, egress and travel within the area.
- 1.1.3 This research study was developed to support the design of a transport framework to reduce congestion and encourage modal shift for people travelling in and around Cambridge, and shape investment from 2020 onwards. The research findings are a valuable addition to the GCP's evidence base and will help them develop measures within their 'Future Investment Strategy' that are most likely to be able to help reduce congestion through changes in transport infrastructure, use of smart technologies, and promoting behaviour change.
- 1.1.4 This report details the research methodology used and the results found.

## 2. METHODOLOGY

- 2.1.1 The population of interest for this survey was residents living in Cambridge and South Cambridgeshire. A target of 1,000 interviews were required in total for both areas. The survey was administered using 'Computer Aided Telephone Interviews' (CATI) and ran between 25<sup>th</sup> September 2017 and 19<sup>th</sup> October 2017.
- 2.1.2 To achieve a representative sample of Cambridge and South Cambridgeshire residents - i.e. to complete the survey with a selection of residents who reflected the same profile as the population of interest - quotas were set on district, gender and age. Quota sampling was chosen over random sampling as it is the more likely method to achieve a representative sample. Random sampling, by its definition, can by chance result in an unrepresentative sample of respondents; in addition, it can bias the sample towards respondents that are more easily reached.
- 2.1.3 Landline and mobile phone numbers were obtained<sup>1</sup> for households/people living in Cambridge and South Cambridgeshire; numbers were dialled at random; and, after introducing the survey, the first questions profiled respondents to check whether they were in quota. Interviews were carried out across a range of days and times of day to help avoid potential bias to particular demographics. Each number was tried at least three times - to cover day time, evening and Saturdays – and could be tried up to five times, after which the number was deemed 'dormant'. Residents were incentivised to take part in the survey by offering them the chance to be entered into a prize draw, for one of three chances to win £100 worth of high street shopping vouchers.
- 2.1.4 It proved particularly difficult to reach 16-24 year olds and, to a lesser extent, people living in Cambridge, 25-49 year olds and men. As such the quotas were not fully met. This meant that the data needed to be weighted to ensure the results were representative of the population of interest. Using ONS Population Estimates for mid-2016, the data was weighted to reflect the true population of Cambridge and South Cambridge residents in terms of gender and age.
- 2.1.5 The table below shows the achieved, unweighted profile of respondents to the survey, in terms of district, gender and age, and the weighted profile. A total of 1,021 interviews were completed and the weighting values required were small.

---

<sup>1</sup> Two different sources of telephone numbers were collated to create a comprehensive database for Cambridge and South Cambridgeshire. The Operator Services Information System (OSIS) file represents the most accurate and cost effective source for the appending of telephone numbers against names and addresses. This is the same database used by companies offering a 118 Directory Enquiry service. Updated daily it also includes landline and mobile telephone numbers where these are provided by operators. The OSIS file does not include numbers that are listed as Ex-Directory. Therefore to boost the numbers available a list of Random Digital Dial (RDD) numbers was purchased. RDD only targets residents with landlines. Using local area dialling codes it is possible to identify those living in Cambridge and South Cambridgeshire.

	Unweighted Frequency	Weighted frequency
<b>District</b>		
Cambridge	424	481
South Cambridgeshire	597	540
<b>Gender</b>		
Male	414	514
Female	606	506
<b>Age</b>		
16 - 24 years old	127	181
25 - 49 years old	366	434
50 - 64 years old	255	208
65+ years old	270	196

- 2.1.6 The survey was designed to capture information about respondents' demographics; current travel behaviour in and around Cambridge and reasons for their travel choices; alternative travel modes; and, the likelihood various potential initiatives might have on their travel choices.
- 2.1.7 The research was undertaken in accordance with the Market Research Society (MRS) code of conduct and a copy of the questionnaire can be found in Appendix A.
- 2.1.8 It should be noted that respondents could refuse to answer questions if they wished; the response base for each question is provided. Please note that where percentages do not total 100%, this is due either to rounding or the multiple response nature of the question.

### 3. SURVEY RESULTS

#### 3.1 Introduction

3.1.1 A total of 1,021 respondents completed the Computer-Aided Telephone Interview (CATI) Survey. To ensure the sample was representative of Cambridge and South Cambridgeshire residents, data was weighted by district, gender and age. The survey results presented in this report are based on the weighted data. An overview of the sample profile is presented in section 3.12 and both the weighted and un-weighted data tables can be found in the appendices.

3.1.2 Sections 3.2 to 3.7 of this chapter set the context for the remainder of the results, detailing the current travel patterns of Cambridge and South Cambridgeshire residents. The current travel patterns are generally as one might expect, being similar to trends in the labour market.

3.1.3 Sections 3.8 to 3.11 provide interesting results on the reasons for people’s travel choices; the alternatives available to them; and, the likelihood various potential initiatives might have on their travel choices.

3.1.4 The results presented can be used as a benchmark for comparing against future years.

#### 3.2 Frequency of Travel

3.2.1 Respondents were asked how often they travel in and around Cambridge. Travel ‘in and around Cambridge’ refers to travel within the built-up area of the city and its outskirts. All 1,021 respondents answered the question, of which:

- 57.1% travelled in and around Cambridge five or more times a week;
- 19.3% travelled two to four times a week;
- 10.4% travelled once a week;
- 7.4% travelled less than once a week, but at least once a month;
- 3.7% travelled less than once a month;
- 1.9% said they never travelled; and
- 0.2% said they ‘Don’t know/ prefer not to say’.

3.2.2 Results show a significant difference in frequency of travel by journey purpose: 86.5% of commuters travel in and around Cambridge five or more times a week, significantly higher than both leisure travellers (57.7%) and those who travel on business/personal business<sup>2</sup> (55.5%).

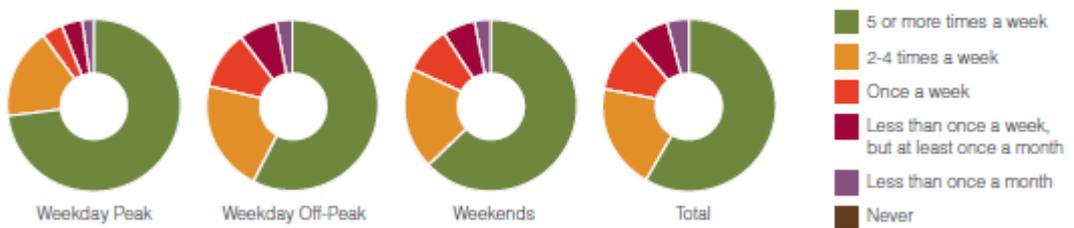

<sup>2</sup> The ‘Business/Personal Business’ category consists primarily of personal business trips (e.g. hospital appointments).

**by Journey Purpose**

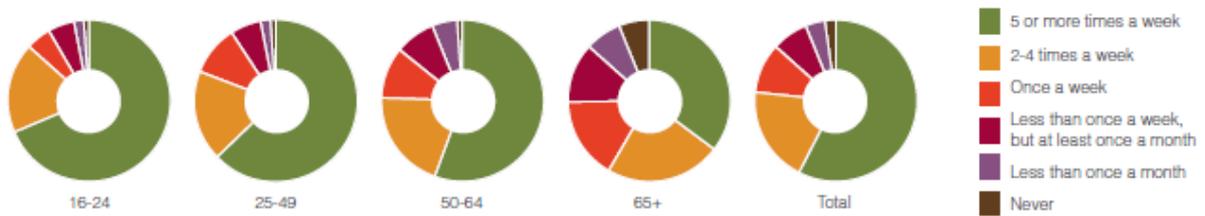

3.2.3 There was also a significant difference in frequency of travel by the time of day people travelled: respondents who travel during weekday peak times are more likely to travel five or more times a week (73.7%) than those who travel during weekday off-peak times (57.4%) or weekends (62.6%).

**by Peak / Off-Peak**

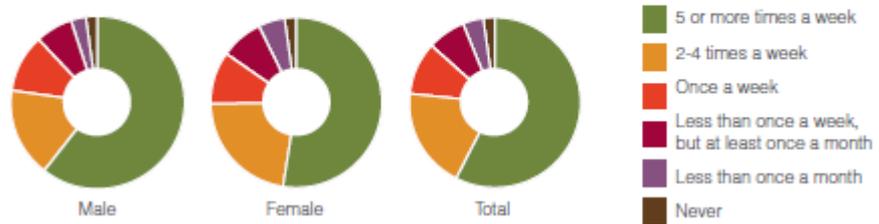

3.2.4 Frequency of travel also differs across age groups. Respondents aged 16-24, 25-49 and 50-64 are all significantly more likely than those aged 65+ to travel in and around Cambridge five or more times a week. Furthermore, those aged 65 and over are the most likely of all age groups to 'Never' travel in and around Cambridge (5.9%, compared to 1.0% of those aged 16-64).

**by Age**

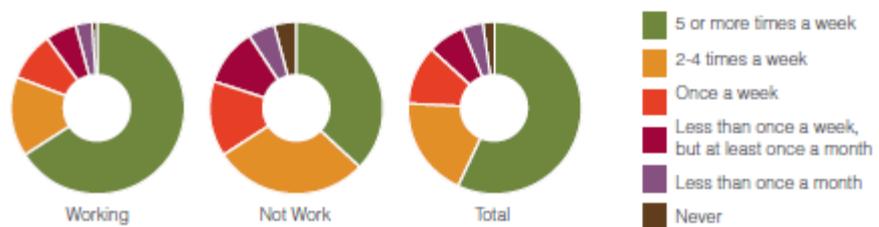

3.2.5 Additionally, there are differences between genders in their frequency of travel in and around Cambridge, with a higher percentage of males stating that they travel five or more times a week than females (61.7% compared with 52.4%, respectively). This pattern is likely driven by the fact that a significantly higher proportion of men than women in the sample work full time (81.4% compared to 46.5%).

**by Gender**

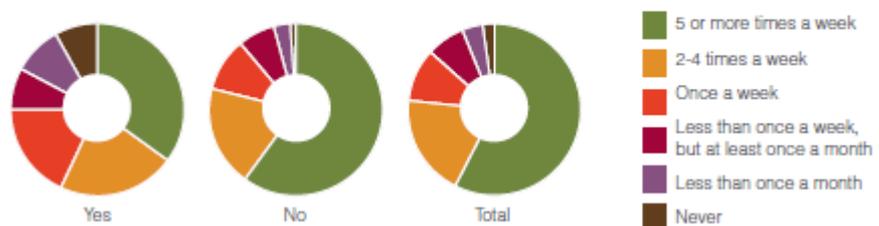

3.2.6 Respondents who work travel more frequently than those who do not work, with the greatest difference between workers and non-workers being the number of respondents who travel five or more times a week: 66.1% of those who work make journeys five or more times a week, compared to 37.1% of respondents who do not work.

**by Working Status**

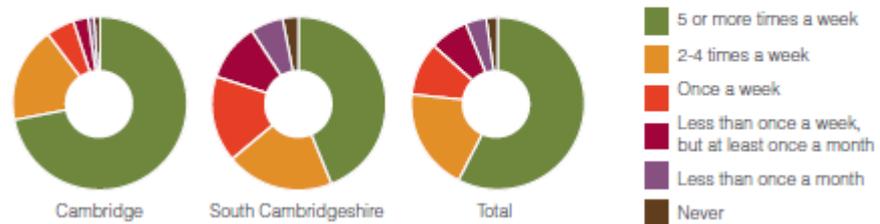

3.2.7 There are further differences in frequency of travel between respondents who have disabilities, and those who do not. Only 34.8% of those with disabilities travel five or more times a week, compared to 60.1% of those without disabilities. In addition, disabled respondents are six times more likely to 'Never' travel than those without disabilities. This finding may be driven by the fact that, in the sample, respondents with disabilities are significantly less likely to be commuters than non-disabled respondents.

**by Disability**

3.2.8 With regards to differences by district, 72.0% of respondents from Cambridge travel five or more times a week, significantly more than respondents from South Cambridgeshire (43.9%). These findings may be explained by the age of respondents, given a higher proportion of South Cambridgeshire residents than Cambridge residents are aged 65 years and over.

## by District

### 3.3 Journey Purpose

3.3.1 Respondents were asked for what reasons they made journeys in and around Cambridge. A total of 998 respondents provided details of their journey purposes. Of these:

- 530 respondents (53.1%) make commuting journeys;
- 697 respondents (69.8%) make leisure journeys; and
- 521 respondents (52.2%) make business/personal business journeys<sup>3</sup>.

3.3.2 Journey purpose has a significant impact on the time of day in which respondents travel. For instance, those who commute are significantly more likely than those travelling for other purposes to travel at peak times on weekdays (89.4% compared to 68.3%).

3.3.3 Journey purpose differs significantly by age. Only 18.2% of respondents aged 65+ commute, compared to 61.0% of younger respondents. The eldest age range make the greatest percentage of business/personal business trips, almost double that of the 16-24 age category.

3.3.4 Whether or not respondents have a disability impacts journey purpose. Respondents who do not have a disability are more than twice as likely to make commuting journeys (56.5%) compared to respondents who have a disability (22.7%). Around half (53.7%) of respondents with a disability were aged 65 years and over, however even if those aged 65 years and over were excluded from this breakdown, those without a disability are still more likely to make commuting journeys than those with a disability.

3.3.5 Journey purpose also differs significantly between the districts in which respondents reside. Respondents from Cambridge are more likely to commute (61.1%) than those from South Cambridgeshire (45.8%). This pattern of results may be attributable in part to the age demographics of these two districts.

### 3.4 Time of Travel

3.4.1 A total of 996 respondents provided details of the times they travel at. Of these:

- 689 respondents (69.2%) travel at peak times on weekdays;
- 660 respondents (66.3%) travel at off-peak times on weekdays; and

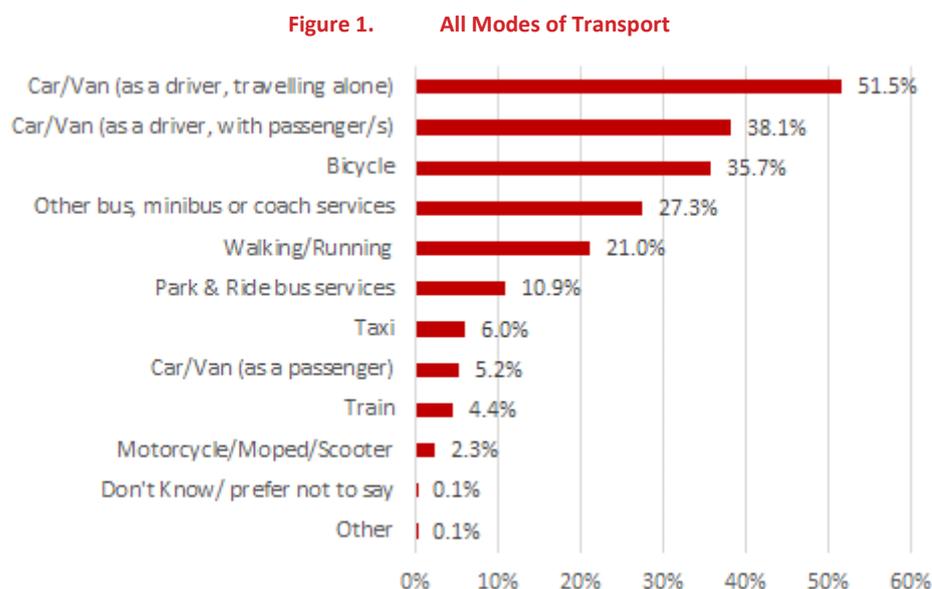

<sup>3</sup> The 'Business/Personal Business' category consists primarily of personal business trips (e.g. hospital appointments).

- 695 respondents (69.8%) travel at weekends.

- 3.4.2 The age of respondents significantly impacts their time of travel. Those aged 65+ make significantly fewer journeys during peak times on weekdays than all other age groups (50% of those aged 65+ travel during weekday peak times, compared to 73.7% of younger respondents).
- 3.4.3 With regards to time of travel by working status, respondents who work are more likely to make journeys at peak times during weekdays than respondents who do not work (76.1% compared to 52.6%, respectively).
- 3.4.4 A similar pattern is found with regards to disability. Those who are not disabled are significantly more likely to make journeys at peak times during weekdays than those who are disabled (71.7% compared with 48.6%, respectively).
- 3.4.5 There is also a significant difference in the number of peak journeys made on weekdays between the two districts: 77.4% of respondents from Cambridge made journeys during this time, compared to 61.7% of those from South Cambridgeshire. This may be, at least in part, due to the differing age demographics between the two districts, with South Cambridgeshire having a greater percentage of residents aged 65 and over.

### 3.5 All Modes of Transport

- 3.5.1 Respondents were asked about the different modes of transport they used to travel in and around Cambridge: Over half of respondents (51.5%) said they used a car/van (as a driver, travelling alone) to make their journeys in and around Cambridge; a further 38.1% said they travelled by car/van (as a driver, with passenger/s); and, 35.7% said they cycled. A full breakdown of modes used can be seen in the Figure below.

- 3.5.2 Cycling is particularly popular amongst commuters compared to those travelling for other journey purposes: 47.7% of commuters said they cycle compared to 38.7% of other respondents. However, commuters residing in Cambridge were more likely to

cycle than commuters from South Cambridgeshire (64.5% compared with 27.3%, respectively).

3.5.3 Commuters are the least likely to utilise Park and Ride services with only 6.6% saying they do so compared to 12.5% of other respondents. Again this varied by where these commuters lived, with 12.0% of commuters from South Cambridgeshire saying they use Park and Ride compared to 2.2% of commuters from Cambridge.

3.5.4 Those travelling for business/personal business were more likely than other respondents to say they travelled by car/van as a driver with passengers (46.9% compared to 37.6%).

**Table 1. All Modes of Transport by Journey Purpose**

All Modes of Transport	Commuting	Leisure	Business / Personal Business	All
Car/Van (as a driver, travelling alone)	57.0%	51.7%	53.1%	51.6%
Car/Van (as a driver, with passenger/s)	34.5%	39.9%	46.9%	38.2%
Bicycle	47.7%	38.9%	38.3%	35.8%
Other bus, minibus or coach services	26.8%	29.0%	28.1%	27.3%
Walking/Running	23.3%	23.4%	25.6%	21.0%
Park & Ride bus services	6.6%	12.0%	13.2%	10.8%
Taxi	6.5%	6.3%	8.6%	6.0%
Car/Van (as a passenger)	4.0%	6.4%	5.9%	5.2%
Train	4.8%	5.4%	6.0%	4.5%
Motorcycle/Moped/Scooter	2.1%	2.1%	1.8%	2.3%
Other	0.2%	0.1%	0.2%	0.1%
<b>Base</b>	<b>529</b>	<b>696</b>	<b>519</b>	<b>997</b>

3.5.5 Looking at the modes of transport people use by age, there are some noticeable differences. Respondents in the youngest and oldest age categories are less likely to drive a car/van than the middle two age groups: 39.1% of those aged 65+ drive a car/van (travelling alone) and 41.6% of 16-24 year olds do, compared with 57.9% of those aged 25-64; similarly, 22.5% of 16-24 year olds drive a car/van (with passengers) and 34.0% of those aged 65+ do so, compared with 43.8% of 25-64 year olds.

3.5.6 In addition: those aged 65+ are far more likely than all other ages to use the Park and Ride services (24.3% compared to 7.9%, respectively); they are more likely to use the other range of bus services (40.6% compared with 24.2%); they are less likely to cycle (15.4% compared with 40.5%); and less likely to walk/run (15.6% compared with 22.3%).

**Table 2. All Modes of Transport by Age**

All Modes of Transport	16-24	25-49	50-64	65+	All
Car/Van (as a driver, travelling alone)	41.6%	57.5%	58.7%	39.1%	51.5%
Car/Van (as a driver, with passenger/s)	22.5%	42.8%	45.9%	34.0%	38.2%
Bicycle	43.7%	39.1%	40.4%	15.4%	35.8%
Other bus, minibus or coach services	25.8%	23.5%	24.3%	40.6%	27.2%
Walking/Running	24.2%	22.7%	19.9%	15.6%	21.1%
Park & Ride bus services	1.3%	8.1%	13.2%	24.3%	10.9%
Taxi	3.4%	6.0%	6.7%	7.7%	6.0%

All Modes of Transport	16-24	25-49	50-64	65+	All
Car/Van (as a passenger)	6.8%	4.4%	4.6%	6.3%	5.2%
Train	3.2%	4.8%	6.9%	2.2%	4.5%
Motorcycle/Moped/Scooter	4.7%	1.9%	1.4%	1.9%	2.3%
Other	0.0%	0.2%	0.0%	0.0%	0.1%
<b>Base</b>	<b>180</b>	<b>429</b>	<b>205</b>	<b>184</b>	<b>997</b>

3.5.7 The most notable difference between males and females was that males are more likely to cycle than females (39.2% compared to 32.2%, respectively).

**Table 3. All Modes of Transport by Gender**

All Modes of Transport	Male	Female	All
Car/Van (as a driver, travelling alone)	53.0%	50.0%	51.5%
Car/Van (as a driver, with passenger/s)	40.7%	35.4%	38.1%
Bicycle	39.2%	32.2%	35.8%
Other bus, minibus or coach services	25.9%	28.9%	27.4%
Walking/Running	20.9%	21.3%	21.1%
Park & Ride bus services	8.6%	13.3%	10.9%
Taxi	5.6%	6.4%	6.0%
Car/Van (as a passenger)	2.9%	7.6%	5.2%
Train	4.3%	4.6%	4.4%
Motorcycle/Moped/Scooter	3.3%	1.3%	2.3%
Other	0.0%	0.2%	0.1%
<b>Base</b>	<b>507</b>	<b>493</b>	<b>999</b>

3.5.8 With regards to socio-economic status, grade DE<sup>4</sup> are significantly less likely to drive a car/van for their journeys than grades AB<sup>5</sup> and C1C2<sup>6</sup>: 40.0% of those in group DE drive a car/van (travelling alone) compared with 58.6% of those in group AB and 51.6% of those in group C1C2; and, 25.3% of those in group DE drive a car/van (with passengers) compared to 40.8% of those in group AB and 42.9% of grade C1C2. It should however be noted that the majority of grade DE respondents were resident in Cambridge, where driving was found to be less common (see Table 8 below).

3.5.9 Interestingly, grade C1C2 has the lowest percentage of cycling journeys of all SEG classifications (27.2% of grade C1C2 cycle, compared to 41.0% of all other respondents).

**Table 4. All Modes of Transport by SEG**

All Modes of Transport	AB	C1C2	DE	All
Car/Van (as a driver, travelling alone)	58.6%	51.6%	40.0%	54.5%

3.5.10 There are also differences in the modes of transport taken by respondents of differing working status. Those who work make significantly more car journeys (travelling alone), 57.7%, compared to those who do not work (37.2%). Respondents who work also make more cycling journeys than those who do not work (40.9% compared with 23.1%, respectively).

**Table 5. All Modes of Transport by Working Status**

## 3.6 Usual Mode of Transport

3.6.1 After detailing all modes of transport respondents used, they were asked which one mode they use most frequently to travel in and around Cambridge. Once again, travelling alone by car/van was the most common form of transport with 37.2% stating this, followed by cycling (19.3%).

**Figure 2. Usual Mode of Transport**

3.6.2 Commuters were more likely than those travelling for other purposes to travel most often by car (travelling alone) and by bicycle (42.4% compared with 36.2%; and 27.0% compared with 20.0%, respectively). On the other hand, business/personal business travellers were almost twice as likely to travel by car/van with passengers than commuters were (20.5% compared to 11.0%, respectively).

**Table 8. Usual Mode of Transport by Journey Purpose**

Usual Mode of Transport	Commuting	Leisure	Business / Personal Business	All
Car/Van (as a driver, travelling alone)	42.4%	36.7%	35.5%	37.7%
Bicycle	27.0%	20.5%	19.4%	19.5%
Car/Van (as a driver, with passenger/s)	11.0%	16.4%	20.5%	16.7%

Other	0.1%	0.1%	0.1%	0.1%
<b>Base</b>	<b>525</b>	<b>691</b>	<b>511</b>	<b>985</b>

3.6.3 Those aged 65+ were the most likely of all the age groups to state that they travel most frequently by Park and Ride services (12.5% compared with 1.9%). However, they were the least likely to travel most often by bicycle (9.1% compared with 22.0% of all other age groups). Those aged 16-24 were less likely than older respondents to drive a car/van with passengers (6.8% compared with 18.9%, respectively).

**Table 9. Usual Mode of Transport by Age**

Usual Mode of Transport	16-24	25-49	50-64	65+	All
Car/Van (as a driver, travelling alone)	31.8%	42.1%	39.8%	30.1%	37.6%
Bicycle	28.1%	19.7%	21.7%	9.1%	19.6%
Car/Van (as a driver, with passenger/s)	6.8%	20.5%	18.9%	15.1%	16.7%
Other bus, minibus or coach services	18.1%	8.0%	6.5%	19.2%	11.6%

<b>Base</b>	<b>176</b>	<b>426</b>	<b>201</b>	<b>183</b>	<b>986</b>

3.6.4 Once again, respondents whose socio-economic status is categorised as C1C2 have the lowest percentage of bike travel of all SEG categories (14.2% compared with 23.3% for the other grades combined). As socio-economic status moves from AB through to DE,

the less likely they are to travel alone by car (42.2% of grade AB do so, compared with 38.7% of C1C2 and 27.9% of DE).

**Table 10. Usual Mode of Transport by SEG**

Usual Mode of Transport	AB	C1C2	DE	All
Car/Van (as a driver, travelling alone)	42.2%	38.7%	27.9%	39.7%
Bicycle	22.3%	14.2%	29.3%	20.1%
Car/Van (as a driver, with passenger/s)	15.9%	20.6%	15.4%	17.5%
Other bus, minibus or coach services	6.3%	12.9%	12.5%	9.2%
Walking/Running	4.5%	4.6%	6.1%	4.7%

Other	0.1%	0.0%	0.0%	0.1%
<b>Base</b>	<b>493</b>	<b>307</b>	<b>81</b>	<b>882</b>

3.6.5 Noticeable differences are also seen between respondents of different working statuses. Respondents who do not work are far less likely than those who do to state that their primary method of transport is traveling alone by car (25.3% compared to 43.0%) or cycling (12.4% compared with 22.6%). However, those not working are more likely to utilise bus/minibus or other coach services (20.0% compared with 7.8% of those who do work).

**Table 11. Usual Mode of Transport by Working Status**

Usual Mode of Transport	Working	Not working	All
Car/Van (as a driver, travelling alone)	43.0%	25.3%	37.7%
Bicycle	22.6%	12.4%	19.6%

### 3.7 Usual Mode of Transport to Work

3.7.1 Respondents who stated that they made commuting journeys to/from work were subsequently asked to identify the mode of transport they usually take for these specific journeys. Of the 477 commuters, driving a car/van, along with cycling, are the most popular modes, with 53.9% and 26.1% stating these respectively.

3.7.2 This question was also asked in the 2011 Census and the breakdown of responses is similar. The most notable differences being that the survey data shows a higher proportion of people cycling to work and a lower proportion walking/running.

**Table 14. Usual Mode of Travelling to Work**

Usual Mode of Transport to Work	Survey Results (%)	Census 2011 (%)
Car/Van (as a driver)	53.9%	50.1%
Bicycle	26.1%	17.3%
Bus, minibus or coach services	7.9%	5.3%
Walking/Running	3.9%	10.6%
Work mainly at or from home	2.7%	7.2%

<b>Base</b>	<b>258</b>	<b>216</b>	<b>473</b>

### 3.8 Reasons for Mode Choice

3.8.1 Respondents were asked to state the reasons why they used the modes of transport they did. They were allowed to give more than one reason. The most frequently cited reasons were reliability of journey (40.6%), speed of journey (38.2%), and distance to destination (22.0%). Availability of information (<1%) and the ability to carry out other tasks during travel (1.2%) seem to have little bearing on mode choice.

**Table 16. Reasons for Mode Choice**

Reason for Mode Choice	Percentage
Reliability of journey	40.6%
Speed of journey	38.2%
Distance to destination	22.0%
Physical comfort	16.2%
Price of transport	16.0%
Health reasons	14.5%
Complexity of journey (e.g. number of connections)	13.7%
Frequency of service	11.1%
More environmentally friendly/ sustainable	9.1%
Work vehicle/ drive for job	6.2%
Price of parking	6.1%
Distance to station/ stop	6.1%
Availability of car parking	5.4%
Personal safety	4.9%
Availability of cycle facilities	3.1%
Ability to do other things while travelling (e.g. work/ read/ etc.)	1.2%
Availability of 'Real Time Information'	0.3%
Availability of other forms of information	0.0%
Other	25.8%
Don't Know/ prefer not to say	0.6%
<b>Base</b>	<b>1001</b>

3.8.2 Around a quarter (25.8%) of respondents gave ‘other’ reasons for their mode choice. The most common reasons given related to:

- Access to public transport;
- Flexibility of travel;
- The need to take passengers or other items;
- Convenience; and
- Lack of alternative options.

*“No public transport to workplace.”*

*“Easier – requires less planning in advance.”*

*“All my work tools are in the van.”*

*“Convenient to get to train station through the cycle route.”*

*“I can’t drive and I find cycling is quicker due to traffic congestion.”*

3.8.3 Respondents from the youngest age range (16-24) are more concerned by the price of transport than members of other age categories (27.5% compared with 13.6%, respectively), and less concerned with the reliability of the journey (30.2% compared with 43.2%, respectively). Respondents aged 65+ were more likely to cite health reasons and physical comfort as their motives for mode choice than other age categories (22.8% compared with 12.8%; and, 23.5% compared with 14.7%, respectively).

**Table 17. Reasons for Mode Choice by Age**

Reason for Mode Choice	16-24	25-49	50-64	65+	All
Reliability of journey	30.2%	44.7%	42.9%	40.1%	40.9%
Speed of journey	32.9%	43.3%	43.0%	27.7%	38.5%

<b>Base</b>	<b>180</b>	<b>425</b>	<b>205</b>	<b>183</b>	<b>992</b>

3.8.4 With regards to socio-economic status, as the status moves from DE through to AB the more likely they were to state speed of journey (41.5%) complexity of journey (17.9%) and frequency of service (13.1%) as a reason for mode choice. As socio-economic status moves from AB through to DE, the more likely they were to cite price of transport (22.5%) and driving for their job (14.7%) as a reason. However, reliability of journey was still the most common reason across all grades.

**Table 18. Reasons for Mode Choice by SEG**

Reason for Mode Choice	AB	C1C2	DE	All

<b>Base</b>	<b>696</b>	<b>292</b>	<b>989</b>

3.8.6 Disabled respondents were far less likely to state speed of journey as their reason for mode choice, compared with non-disabled respondents (19.9% compared with 40.5%, respectively). Instead, those who are disabled are more likely to cite health reasons as their motive for choosing particular modes (44.3% compared with 11.7% of non-disabled respondents).

**Table 20. Reasons for Mode Choice by Disability**

Reason for Mode Choice	Disability Identified	No disability	All
Reliability of journey	31.8%	41.9%	40.9%
Speed of journey	19.9%	40.5%	38.5%
Distance to destination	20.5%	22.6%	22.4%
Price of transport	18.5%	16.0%	16.3%
Physical comfort	21.0%	15.5%	16.0%
Health reasons	44.3%	11.7%	14.8%
Complexity of journey (e.g. number of connections)	10.1%	14.2%	13.8%
Frequency of service	7.5%	11.4%	11.0%
More environmentally friendly/ sustainable	6.4%	9.6%	9.3%
Work vehicle/ drive for job	0.0%	7.0%	6.4%

<b>Base</b>	<b>95</b>	<b>887</b>	<b>982</b>

3.8.7 There are also significant differences in reasons for mode choice between the districts in which respondents reside. Residents of Cambridge were more likely to cite health reasons and sustainability as their reasons for mode choice than residents of South Cambridgeshire (21.3% compared to 8.5%, and 15.9% compared to 3.1%, respectively).

**Table 21. Reasons for Mode Choice by District**

Reason for Mode Choice	Cambridge	South Cambridgeshire	All
Reliability of journey	39.2%	42.3%	40.8%
Speed of journey	39.1%	37.8%	38.4%
Distance to destination	24.3%	20.3%	22.2%
Physical comfort	15.9%	16.7%	16.3%
Price of transport	18.2%	14.3%	16.1%
Health reasons	21.3%	8.5%	14.6%
Complexity of journey (e.g. number of connections)	12.2%	15.3%	13.8%
Frequency of service	8.9%	13.1%	11.1%
More environmentally friendly/ sustainable	15.9%	3.1%	9.2%
Work vehicle/ drive for job	6.5%	6.1%	6.3%
Price of parking	5.7%	6.6%	6.2%
Distance to station/ stop	3.4%	8.5%	6.1%
Availability of car parking	3.9%	6.8%	5.4%
Personal safety	6.0%	3.9%	4.9%

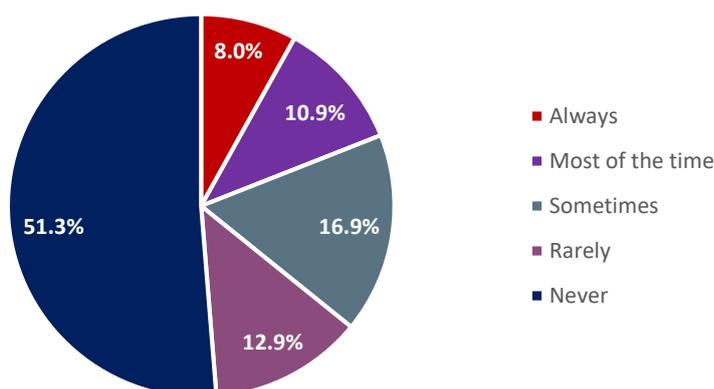

Reason for Mode Choice	Cambridge	South Cambridgeshire	All
Availability of cycle facilities	5.0%	1.4%	3.1%
Ability to do other things while travelling (e.g. work/read/ etc.)	1.3%	1.1%	1.2%
Availability of 'Real Time Information'	0.7%	0.0%	0.3%
Availability of other forms of information	0.0%	0.0%	0.0%
Other	20.8%	30.6%	25.9%
<b>Base</b>	<b>472</b>	<b>523</b>	<b>995</b>

3.8.8 The reasons for using different modes also vary between the types of transport people use. Car/van drivers were more likely to cite 'reliability of journey' as a reason for mode choice than any other reason (46.4% of those travelling alone said this and 43.9% of those travelling with passengers said so); cyclists were more likely to cite speed of journey than any other reason (with 63.2% saying this); park and ride users' most common response was the price of transport (33.7%), while users of other buses, minibuses or coach services were more likely to say reliability; and, health reasons were the most common reason for walking/running (45.2%).

### 3.9 Journey Planning

3.9.1 The figure below shows how many respondents currently check travel conditions before starting their journeys, with just over half (51.3%) stating they never do. However, those who predominantly drive a car/van are more likely to check travel conditions than those who predominantly use another form of transport (55.9% compared to 40.0%, respectively).

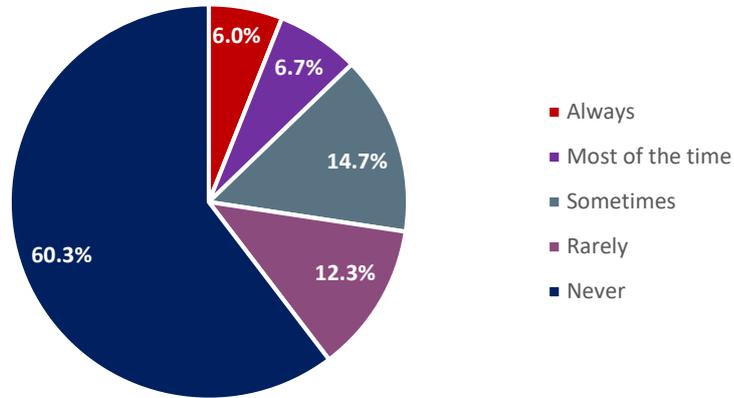

**Figure 3. Do you check travel conditions before starting your journeys?**

Base: 1,001

3.9.2 Figure 3 shows the percentage of respondents for whom information regarding travel conditions influences their mode of transport. Nearly two thirds (60.3%) of respondents said this information never influences their choice of mode. However, those who predominantly drive a car/van are more likely to say it does influence them than those who predominantly use another form of transport (43.5% compared to 34.4%, respectively).

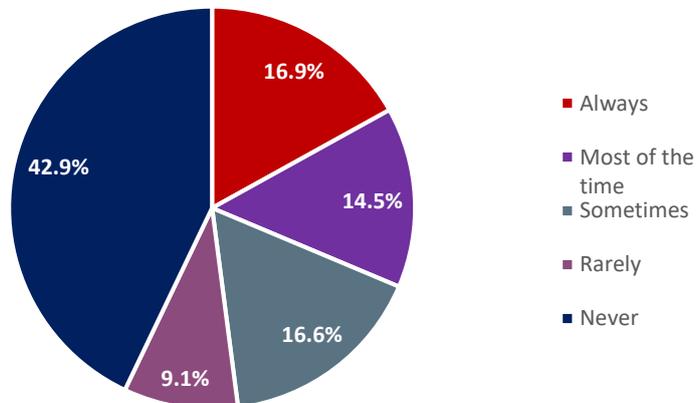

**Figure 4. Does information about congestion or delays influence your choice of transport mode?**

Base: 1,001

3.9.3 Figure 4 shows the percentage of respondents who check the weather forecast before starting their journeys, with 57.1% doing so, even if only rarely. Respondents who predominantly cycle, walk or run are much more likely than other respondents to check the weather (76.8% compared with 50.7%, respectively).

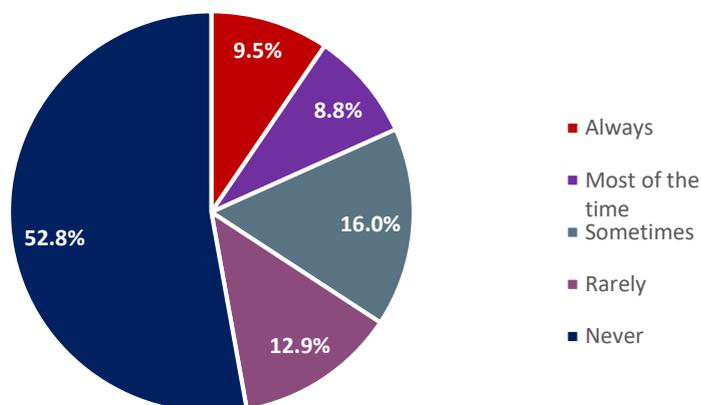

**Figure 5. Do you check the weather forecast before starting your journeys?**

Base: 1,001

3.9.4 The figure below shows the percentage of respondents for whom the weather conditions influence their choice of transport, with 47.2% saying they do, if only rarely. Again, cyclists and those who walk/run are more likely to be influenced by weather conditions than other respondents (61.5% compared with 42.5%, respectively).

**Figure 6. Do weather conditions influence your choice of transport?**

Base: 1,001

### 3.10 Alternative Modes

3.10.1 Respondents who indicated that they use a car/van to make journeys in and around Cambridge were subsequently asked if they could make these journeys using any other mode. Whilst nearly a third (31.9%) of these respondents stated that bus, minibus or coach services were available to them, two in five respondents (39.0%) said they had no other modes of transport they could use.

**Table 22. Alternative Modes of Transport available to Car/Van users**

Alternative Modes Available	Percentage
Other bus, minibus or coach services	31.9%
Bicycle	25.0%
Park & Ride bus services	11.7%
Taxi	10.8%
Walking/Running	6.8%
Train	6.4%
Motorcycle/Moped/Scooter	1.8%
Other	0.1%
None of the above	39.0%
Don't Know/ prefer not to say	0.6%
<b>Base</b>	<b>681</b>

3.10.2 Commuters were more likely than those travelling for other purposes to say they could make their car/van journeys by bicycle (34.8% compared to 27.7% of leisure travellers and 22.9% of those travelling for business/personal business); and, less likely to say they could do so by bus, minibus or coach services (26.1% compared to 35.3% of leisure travellers and 32.4% of those travelling for business/personal business).

- 3.10.3 Those aged 65 years and over were less likely than younger respondents to say cycling was an option (9.6% compared with 28.2%, respectively); and, more likely to say there were no other options available to them (46.6% compared with 38.0%).
- 3.10.4 People with disabilities were more likely than those without disabilities to say taxi was an alternative (21.2% compared with 9.9%); and, less likely to say that cycling was an option (10.1% compared with 26.8%).
- 3.10.5 Respondents living in Cambridge were more likely than those in South Cambridgeshire to say the following modes were possible alternatives: taxi (17.5% compared with 6.6%); cycling (37.4% compared with 17.4%); and walking/running (14.0% compared with 2.2%). Respondents living in South Cambridgeshire were more likely than those in Cambridge to say there were no alternatives available to them (43.6% compared with 32.4%).
- 3.10.6 A range of reasons were given by respondents as to why they do not use alternative modes of transport. Speed (28.3%), reliability (25.9%), and the price of using public transport (20.5%) are the three most cited reasons as to why alternative modes are not utilised.

**Table 23. Why don't you travel by alternative modes?**

Reason why alternative modes not used	Percentage
Speed of journey	28.3%
Reliability of journey	25.9%
Price of transport	20.5%
Distance to destination	18.4%
Complexity of journey (e.g. number of connections)	15.0%
Physical comfort	14.0%
Frequency of journey	12.2%
Distance to station/ stop	7.7%
Work vehicle/ drive for job	7.2%
Health reasons	5.5%
Personal safety	4.3%
Price of parking	3.0%
Ability to do other things while travelling (e.g. work/ read/ etc.)	2.2%
Availability of car parking	1.6%
More environmentally friendly/ sustainable	0.7%
Availability of cycle facilities	0.7%
Availability of 'Real Time Information'	0.6%
Availability of other forms of information	0.3%
Other	29.9%
Don't Know/ prefer not to say	4.9%
<b>Base</b>	<b>681</b>

- 3.10.7 Nearly a third (29.9%) of respondents gave 'other' reasons as to why they couldn't use alternative modes of transport. Of these 'other' reasons, the most common types of response related to:

- Lack of public transport;

- The need to take passengers or other items;
- Convenience; and
- Flexibility of travel.

*“Bus doesn’t run early enough.”*

*“Carrying things in the car that would be difficult on public transport.”*

*“Convenience of it being easier to use a car when weather is bad.”*

*“The car is the easiest option, particularly when travelling with the children.”*

*“Working hours are unpredictable.”*

- 3.10.8 Health reasons were given as a reason to not use alternative modes more frequently by those aged 65 years and older (19.5% compared with 3.3% of younger respondents); those who were not working (15.4% compared to 2.7% of those who were working); and those with a disability (34.2% compared with 3.0% of those with no disability).
- 3.10.9 Speed of journey was given as a reason for not using alternative modes more frequently as socio-economic status moved from DE through to AB (18.6% of DE compared with 22.9% of C1C2 and 34.6% of grade AB); and respondents without a disability were also more likely than those without a disability to state this (31.3% compared with 14.3%, respectively).
- 3.10.10 Physical comfort was a more common reason for not using alternatives among those in socio-economic grade DE (26.6% compared with 13.0% of the other grades); and among those who were not working (22.8% compared with 12.2% of those who were working).
- 3.10.11 Price of transport was a more common reason for not using alternatives among residents of Cambridge (28.2%), compared to residents of South Cambridgeshire (17.5%).
- 3.10.12 Respondents were then asked to state which mode of transport they would use if driving was no longer an option for them. Almost a third (31.9%) of respondents would use a bus, minibus or coach service, and one in five (19.7%) would cycle instead.

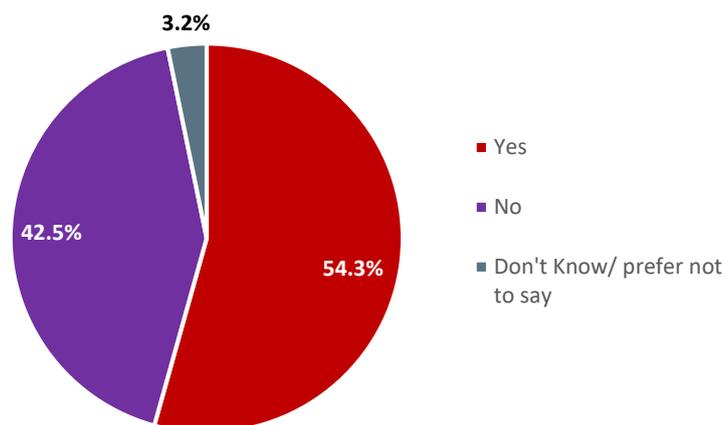

**Table 24. If driving was no longer an option for you, which mode would you use?**

Which mode would you use?	Percentage
Other bus, minibus or coach services	31.9%
Bicycle	19.7%
Taxi	13.0%
Train	9.6%
Park & Ride bus services	6.7%
Walking/Running	6.0%
Motorcycle/Moped/Scooter	2.7%
I wouldn't travel	12.5%
I have to drive as part of my job	4.5%
I would still drive, no matter what	3.9%
Other	7.1%
Don't Know/ prefer not to say	5.9%

Which mode would you use?	Percentage
Base	681

3.10.13 Respondents were also asked whether they would like to make more journeys in and around Cambridge without their own car/van. There was a mixed response, with just over half (54.3%) of respondents saying 'Yes', but more than two in five respondents (42.5%) saying 'No'.

**Figure 7. Would you like to make more journeys without your own car/van?**

Base: 681

3.10.14 The proportion of respondents who would like to make more journeys without their own car/van differs significantly by age and gender: Respondents aged 65 years and over were the least likely to want to change their mode of transport (41.0%), whereas respondents aged 25-49 were most receptive to doing so (62.3%); and females were more likely than males to say they wanted to (61.9% compared to 50.6%).

### 3.11 Potential initiatives to encourage or enable reduced car/van use

3.11.1 Respondents were presented with 32 potential initiatives, each aimed at encouraging a reduction in car/van use. Respondents were asked to rate each one in terms of the extent to which it might encourage this behaviour. Each initiative was then given a score based on the number of respondents who said the initiative was 'Very Likely' or 'Somewhat likely' to encourage them to use other modes of transport.

3.11.2 The five most popular initiatives were found to be:

- Introducing new public transport routes;
- Improving reliability of public transport services;
- Making public transport cheaper;
- Improving the frequency of services on public transport; and
- Introducing free parking at Park & Ride sites.

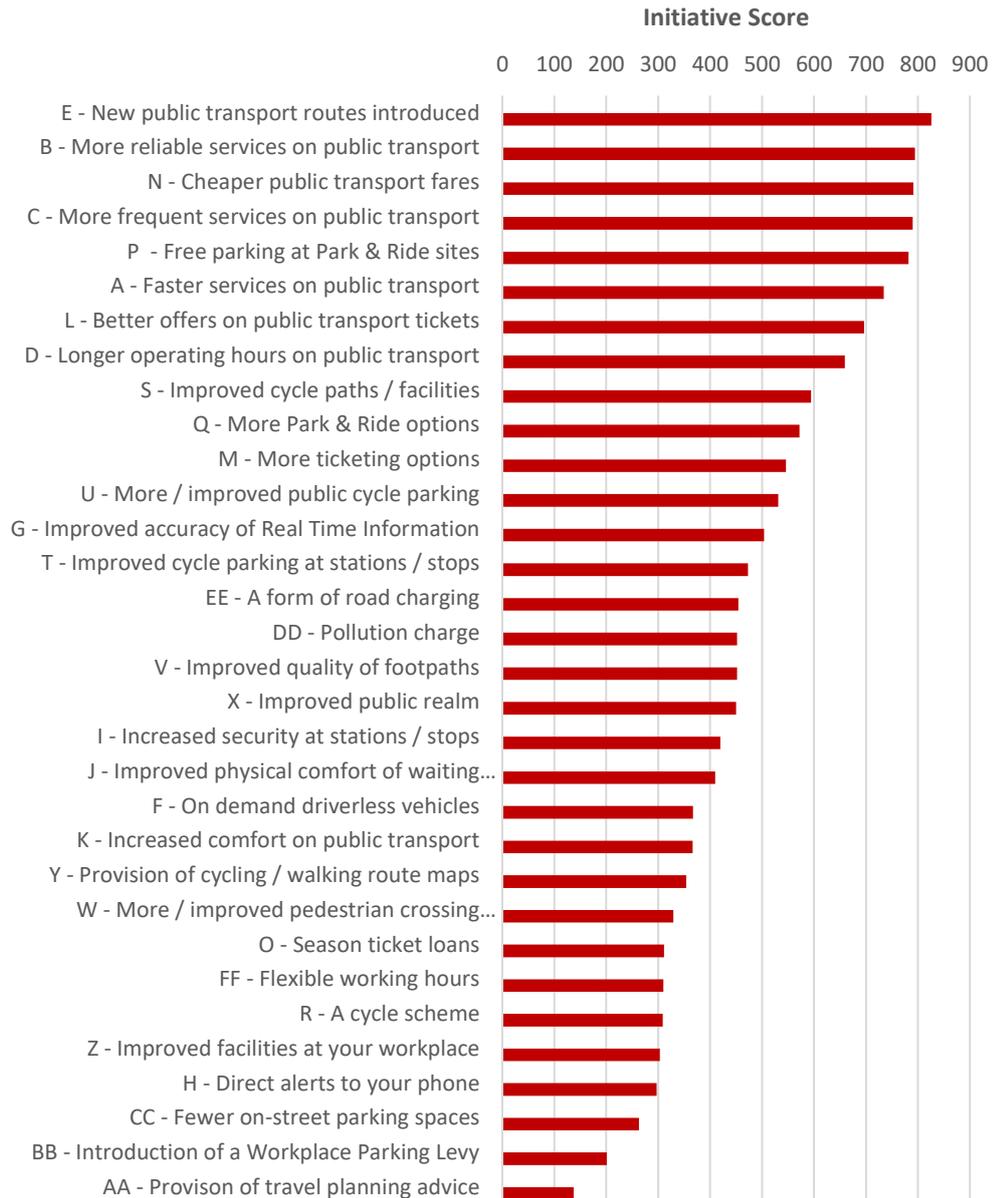

3.11.3 The five least popular initiatives were found to be:

- Provision of travel planning advice;

- Introducing a workplace parking levy;
- Reducing the number of on-street parking spaces;
- Providing direct alerts to your phone; and
- Improving workplace facilities.

3.11.4 The ranking of all initiatives is shown in Figure 7.

**Figure 8. Ranking of the 32 Initiatives**

3.11.5 The likelihood of an initiative encouraging a reduction in car/van use significantly differs by age. For instance, those aged 65+ are significantly less likely to change their mode than other age ranges, if the price of public transport was reduced (41.7% compared to 73.0% for younger respondents). Additionally, respondents aged 16-24 are significantly less likely to change their mode based on increased frequency of public transport services, relative to older respondents (55.6% compared with 72.2%, respectively).

- 3.11.6 There are also differences between genders with for some of the initiatives. Females are significantly more likely than males to change their mode based on cheaper public transport fares (73.4% compared with 61.8%) and increased frequency of services (74.6% compared with 63.0%).
- 3.11.7 If new public transport routes were introduced, then respondents who work would be more likely to change their mode than non-workers (72.5% compared to 67.6%, respectively); as would be the case if public transport fares were made cheaper (71.9% compared with 52.1%).
- 3.11.8 Respondents without disabilities are more likely than those with disabilities to change their mode if free parking is introduced at Park and Ride sites (67.7% compared with 51.1%, respectively). This initiative would also be valued by the residents of South Cambridgeshire more than Cambridge (72.9% compared with 55.8%, respectively).
- 3.11.9 In addition to the list of initiatives, respondents were asked if there was anything else that could encourage them out of their cars/vans. Whilst most suggestions were closely related to the initiatives, there were some novel ideas proposed.
- 3.11.10 A popular theme that emerged from this question was the appetite for the development of alternative forms of transport. These suggestions included the provision of additional rail services / stations, tram systems, and an underground network.

*“Create a train station at Addenbrookes.”*

*“Reintroduce the railways services.”*

*“Something like a tram would be handy.”*

*“Underground network. Could be a good way forward. Going to keep growing. Right ground for tunnelling. Expensive, but a long-term investment.”*

Some respondents suggested that new schemes were set up, or incentives were provided to encourage the use of public transport.

*“Financial Incentive – tax relief for using public transport.”*

*“A car share scheme – both the rider and driver would gain financial benefit.”*

*“A taxi scheme that is subsidised would be good when I can’t drive anymore.”*

Although respondents were given the opportunity to select initiatives related to security earlier in the survey, some felt it was necessary to re-iterate the importance of personal safety.

*“Better lighting. I think it’s all about feeling safe.”*

*“Lighting needs to be improved. No police control, and no safety, especially for women.”*

**3.12 Profile of Respondents**

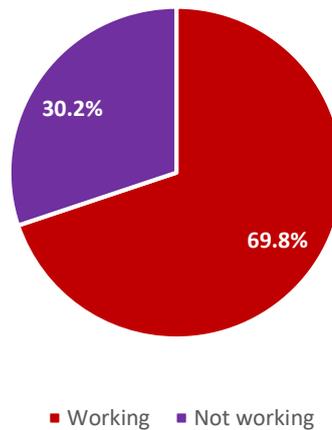

3.12.1 In total, 1,021 respondents completed the survey, of which 1,018 provided both their age and gender. Table 27 provides a breakdown of respondent age and gender.

**Table 25. Age and Gender of Respondents**

Age	Male	Female	Total
16 - 24	9.2%	8.5%	<b>17.7%</b>
25 - 49	22.3%	20.4%	<b>42.6%</b>
50 - 64	10.2%	10.2%	<b>20.4%</b>
65+	8.8%	10.4%	<b>19.2%</b>
<b>Total</b>	<b>50.5%</b>	<b>49.5%</b>	<b>1,018</b>

3.12.2 In terms of working status, over two-thirds (69.8%) were working either full-time or part-time. The remaining 30.2% were not working, including students and respondents who were retired.

**Figure 9. Working status of respondents**

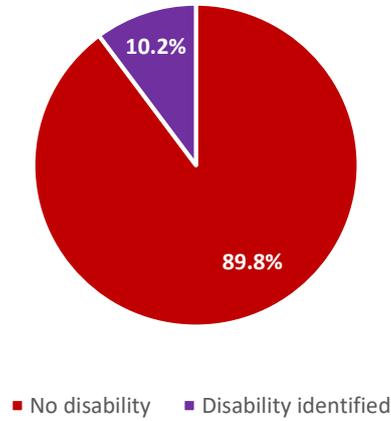

Base: 1,015

3.12.3 Of the 910 respondents who indicated their socio-economic grade (SEG), the sample breakdown was as follows:

- 55.3% were 'AB' - Higher & intermediate managerial, administrative, professional occupations;
- 35.6% were 'C1' or 'C2' - Supervisory, clerical & junior managerial, administrative, professional occupations or skilled manual occupations; and
- 9.2% were 'DE' - Semi-skilled & unskilled manual occupations, unemployed and lowest grade occupations.

3.12.4 Of the 1,007 respondents who answered the question regarding whether they have any disabilities, 10.2% of the sample reported having a disability. The majority of those who said they had a disability indicated that they had a mobility impairment.

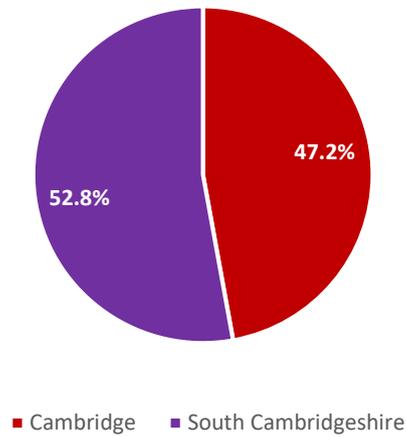

**Figure 10. Disability**

Base: 1,007

- 3.12.5 Of those with a disability, just over half (53.7%) were aged 65 years and over, and less than a quarter (22.7%) made commuting journeys in and around Cambridge.
- 3.12.6 With regards to the area in which respondents reside, just over half (52.8%) of the sample live in South Cambridgeshire.

**Figure 11. Area of residence**

Base: 1,021

## 4. CONCLUSIONS

### 4.1 What journeys are currently made in and around Cambridge?

- 4.1.1 More than three quarters of respondents travel in and around Cambridge at least twice a week, with the majority doing so five or more times a week.
- 4.1.2 Over two thirds of respondents make leisure journeys, and over half make commuting journeys and business/personal business journeys.
- 4.1.3 Over half of respondents usually travel by car/van, with the majority doing so alone without any passengers. Around a fifth of respondents usually travel by bicycle. Car/van drivers (travelling alone) were most likely to be commuters, aged 25-64, of AB socio-economic grade, and live in South Cambridgeshire. Bicycle users were also most likely to be commuters, but to be aged 16-24, of DE socio-economic grade, and to live in Cambridge.
- 4.1.4 There is a noticeable difference in the demographic profile of residents in Cambridge and South Cambridgeshire, resulting in some key differences in the way people travel. There is a higher proportion of residents aged 65 years and over in South Cambridgeshire, compared to Cambridge, resulting in less frequent journeys and less commuting journeys being made, but a higher proportion of car use. In addition, perhaps due to the demographic profile or the greater distance to the city centre, cycling, walking and running appear far less of an option for South Cambridgeshire residents.
- 4.1.5 It should also be noted that people with disabilities tend to make different journeys to those without disabilities: they tend to travel less frequently and are less likely to be commuting; and, while driving a car/van without passengers is still the most likely mode of transport, they are more likely than other respondents to travel as a passenger in a car/van and to travel by bus/minibus or coach service. A very small proportion of people with disabilities cycle. People with disabilities are also more likely than other respondents to consider taxis an option.

### 4.2 What factors influence current mode choice?

- 4.2.1 Respondents were asked to state the reasons why they used a particular mode of transport most often. The most frequently cited reasons were reliability of journey, speed of journey, and distance to destination. Availability of information and the ability to carry out other tasks during travel seem to have little bearing on mode choice.
- 4.2.2 The reasons for using different modes varied by the type of transport most often used. Those who usually drove a car/van were more likely to cite 'reliability of journey' than any other reason; cyclists were more likely to cite speed of journey; park and ride users' most common response was the price of transport, while users of other buses, minibuses or coach services were more likely to say reliability; and, health reasons were the most common reason for walking/running.
- 4.2.3 Regarding area and disability: Cambridge residents were more likely than residents of South Cambridgeshire to cite health reasons and sustainability as their reasons for mode

choice; and, disabled respondents were more likely than those without a disability to cite health reasons and less likely to state speed of journey.

4.2.4 Less than a fifth of respondents 'always' check or check 'most of the time' the travel conditions before starting their journeys, and even fewer are influenced by this information. However, those who predominantly drive a car/van are more likely to check travel conditions and more likely to be influenced by this information than those who predominantly use another form of transport.

4.2.5 Similarly, less than a third of respondents 'always' check or check 'most of the time' the weather forecast before travelling, and even fewer are influenced by this information. Respondents who predominantly cycle, walk or run are much more likely than other respondents to check the weather and to be influenced by it.

### 4.3 What are the motivators and barriers to switching to more sustainable travel choices?

4.3.1 Car/van drivers were asked whether they would like to make more journeys in and around Cambridge without their own car/van. There was a mixed response, with just over half saying 'Yes', but more than two in five saying 'No'.

4.3.2 They were also asked, of the journeys they currently make by car/van, could they use a different mode of transport. Nearly a third stated that they could use bus, minibus or coach services and a quarter stated they could cycle, demonstrating some potential for mode shift. However, a fifth said they had no alternative.

4.3.3 Reasons for not using alternatives to car/van included the speed and reliability of the journey, the price of using public transport, the distance to destination and complexity of journey. Alternative modes need to compete with driving on these attributes if mode shift is to be encouraged.

4.3.4 It should be noted that the price of using public transport was a more common reason for not taking up alternative modes among residents in Cambridge, than in South Cambridgeshire.

4.3.5 Respondents were presented with 32 potential initiatives, each aimed at encouraging a reduction in car/van use. The five most popular initiatives were found to be:

- Introducing new public transport routes;
- Improving reliability of public transport services;
- Making public transport cheaper;
- Improving the frequency of services on public transport; and
- Introducing free parking at Park & Ride sites.

4.3.6 The five least popular initiatives were:

- Provision of travel planning advice;
- Introducing a workplace parking levy;
- Reducing the number of on-street parking spaces;
- Providing direct alerts to your phone; and
- Improving workplace facilities.

- 4.3.7 In general, public transport improvements (frequency, routes, fares/offers, speed, operating hours) ranked highest, whereas 'softer' initiatives such as travel planning and workplace initiatives (season ticket loans, cycle schemes) were least likely to encourage modal shift. Walking and cycling infrastructure improvements (cycle paths/footways) and charging mechanisms (road charging or pollution charging) ranked in the middle of the choice of initiatives.
- 4.3.8 Residents in South Cambridgeshire were more likely than those in Cambridge to change their mode if free parking were introduced at Park and Ride sites. Younger respondents were also more sensitive to fares.

## Cambridgeshire Travel Survey

### Methodology: CATI

Good [\[afternoon/evening\]](#). My name is [\[interviewer name\]](#) and I am conducting a survey on behalf of the Greater Cambridge Partnership to better understand residents' travel behaviour and reasons for their travel choices. Please can you spare 10 minutes to answer some questions?

[\[If required\]](#) The findings from the survey will help the Greater Cambridge Partnership better understand your transport needs. If you complete this survey you can choose to be entered into a prize draw, with three winners each receiving £100 worth of high street shopping vouchers.

- 1 Yes [\[Continue\]](#)
- 2 No [\[Thank & close\]](#)

Thank you. Your answers will remain totally anonymous and will only be used for research purposes. We adhere to the Market Research Society code of conduct and all data will be held in accordance with the data protection act.

We first need to ask a few questions to ensure that the people we speak to are representative of all people living in the local area. Please can I take a few personal details...?

- 1 Yes [\[Continue\]](#)
- 2 No [\[Thank & close\]](#)

### Screeners

**S1. Which of the following age groups do you fall under?** [\[Single response\]](#)

- 1 Under 16 [\[Thank & close\]](#)
- 2 16-24 years old
- 3 25-49 years old
- 4 50-64 years old
- 5 65+ years old
- 6 Prefer not to say [\[Do NOT read out\]](#)

**S2. Please can you confirm, are you....?** [\[Single response\]](#)

- 1 Male
- 2 Female
- 3 Other/Prefer not to say [\[Do NOT read out\]](#)

**S3. Which of the following best describes your current situation?** [\[Single response\]](#)

- 1 Working full-time (30+ hours a week)
- 2 Working part-time (less than 30 hours a week)
- 3 Not working
- 4 Retired
- 5 Student
- 6 Other, please specify \_\_\_\_\_
- 7 Prefer not to say [\[Do NOT read out\]](#)

**S4. What is the occupation of the main income earner in your household?** If the main income earner is retired, please select the option that best describes what their occupation was before they retired. [\[Single response\]](#)

- 1 Higher managerial, administrative or professional
- 2 Intermediate managerial, administrative or professional
- 3 Supervisory or clerical and junior managerial, administrative or professional
- 4 Skilled manual worker
- 5 Semi or unskilled manual worker
- 6 Casual worker, pensioner (reliant on state pension only), or dependent on state welfare
- 7 Don't know/prefer not to say [\[Do NOT read out\]](#)

**S5.** [\[Insert District from database\]](#)

### Current Travel Behaviour

I'd now like to ask you about your current travel behaviour in and around Cambridge. By 'in and around Cambridge' we mean travelling within the built-up area of the city and its outskirts.

**Q1. How often do you travel in and around Cambridge?** [\[Single response\]](#)

- 1 5 or more times a week
- 2 2-4 times a week
- 3 Once a week
- 4 Less than once a week, but at least once a month
- 5 Less than once a month
- 6 Never [\[Skip to 'Demographics' section\]](#)
- 7 Don't know/prefer not to say [\[Do NOT read out\]](#)

**Q2. For which of the following reasons do you make these journeys? (Please select all that apply)** [\[Multiple response\]](#)

- 1 Commuting to/from work
- 2 Commuting to/from education
- 3 School drop off/pick up
- 4 Employer's business
- 5 Personal business
- 6 Leisure activities
- 7 Other, please specify \_\_\_\_\_
- 8 Don't know/prefer not to say [\[Do NOT read out\]](#)

**Q3. At which of these times of day do you travel in and around Cambridge? (Please select all that apply)**

[Multiple response]

- 1 Weekdays from 4am and before 7am
- 2 Weekdays from 7am and before 10 am
- 3 Weekdays from 10am and before 4pm
- 4 Weekdays from 4pm and before 7pm
- 5 Weekdays from 7pm and before 4am
- 6 Saturdays
- 7 Sundays
- 8 Don't know/prefer not to say [Do NOT read out]

	<b>Q4a. Which of the following modes of transport do you use to make these journeys? (Please select all that apply) [Multiple response]</b>	<b>Q4b. Which <u>ONE</u> of these modes of transport do you use most often to travel in and around Cambridge? [Single response]</b>	<b>Q4c. [If Q2=1] How do you <u>usually</u> travel to work? If you use more than one mode please select the mode you use for the longest part, by distance, of your usual journey to work. [Single response]</b>

**Q4d.** [If Q2=1 and Q4c ≠ 1] What is the full postcode of your place of work?

Work postcode \_\_\_\_\_

1 Don't know/prefer not to say [Do NOT read out]

**Q5.** [If Q4b ≠ 13] Why do you travel in and around Cambridge most often by [insert answer to Q4b]?

[Do NOT read out]

[Probe if necessary and code below]

[If respondent states 'convenience', probe for why it is convenient and code accordingly]

[Multiple response]

1 Speed of journey

2 Reliability of journey

3 Frequency of service

4 Distance to destination

5 Distance to station/stop

6 Availability of cycle facilities

7 Availability of car parking

8 Price of transport

9 Price of parking

10 Availability of 'Real Time Information'

11 Availability of other forms of information

12 Personal safety

13 Physical comfort

14 Ability to do other things while travelling  
(e.g. work/read/etc)

15 More environmentally friendly/sustainable

16 Health reasons

17 Complexity of journey

(e.g. number of connections)

18 Work vehicle/ Drive for job

19 Other, please specify \_\_\_\_\_

20 Don't know/prefer not to say

**Q6a.** Do you check travel conditions before starting your journeys?

1 Always

2 Most of the time

3 Sometimes

4 Rarely

5 Never

**Q6b.** Does information about traffic congestion or other transport delays influence your choice of transport mode?

1 Always

2 Most of the time

3 Sometimes

4 Rarely

5 Never

**Q6c.** Do you check the weather forecast before starting your journeys?

1 Always

2 Most of the time

3 Sometimes

4 Rarely

5 Never

**Q6d. Do weather conditions influence your choice of transport mode?**

- 1 Always
- 2 Most of the time
- 3 Sometimes
- 4 Rarely
- 5 Never

**Q7. [If Q4a=2 or Q4a=3 or Q4a=4] Of the journeys you make by car/van, could you make these journeys using any of the following modes of transport instead? (Please select all that apply) [Multiple response]**

- 1 Taxi
- 2 Train
- 3 Park & Ride bus services
- 4 Other bus, minibus or coach services
- 5 Motorcycle/Moped/Scooter
- 6 Bicycle
- 7 Walking/Running
- 8 Other, please specify \_\_\_\_\_
- 9 None of the above [Single response]
- 10 Don't know/prefer not to say [Do NOT read out]

**Q8. [If Q4a=2 or Q4a=3 or Q4a=4] And why [don't/can't] you travel by [this/these] alternative modes of transport?**

[Do NOT read out]

[Probe if necessary and code below]

[If respondent states 'convenience', probe for why it isn't convenient and code accordingly]

- 3 Don't know/prefer not to say [Do NOT read out]

**Q11.** [If Q4a=2 or Q4a=3 or Q4a=4] To what extent would each of the following potential initiatives encourage or enable you to reduce your use of your car/van, and use other modes of travel instead? Please note, there are 32 potential initiatives to quickly run through. (Please select all that apply) [Randomise order] [Single response per row]

	Very likely	Somewhat likely	Not likely at all	Don't know/prefer not to say [Do NOT read out]
a) Faster services on public transport	<input type="checkbox"/> 1	<input type="checkbox"/> 2	<input type="checkbox"/> 3	<input type="checkbox"/> 4
b) More reliable services on public transport	<input type="checkbox"/> 1	<input type="checkbox"/> 2	<input type="checkbox"/> 3	<input type="checkbox"/> 4
c) More frequent services on public transport	<input type="checkbox"/> 1	<input type="checkbox"/> 2	<input type="checkbox"/> 3	<input type="checkbox"/> 4
d) Longer operating hours on public transport	<input type="checkbox"/> 1	<input type="checkbox"/> 2	<input type="checkbox"/> 3	<input type="checkbox"/> 4
e) New public transport routes introduced	<input type="checkbox"/> 1	<input type="checkbox"/> 2	<input type="checkbox"/> 3	<input type="checkbox"/> 4
f) On demand driverless vehicles (e.g. autonomous taxis/buses)	<input type="checkbox"/> 1	<input type="checkbox"/> 2	<input type="checkbox"/> 3	<input type="checkbox"/> 4
g) Improved accuracy of 'Real Time Information' displays and 'Real Time Information' displays at all stations/stops	<input type="checkbox"/> 1	<input type="checkbox"/> 2	<input type="checkbox"/> 3	<input type="checkbox"/> 4
h) Direct public transport alerts and/or direct weather alerts to your mobile phone	<input type="checkbox"/> 1	<input type="checkbox"/> 2	<input type="checkbox"/> 3	<input type="checkbox"/> 4
i) Increased security (e.g. lighting/CCTV) at stations/stops	<input type="checkbox"/> 1	<input type="checkbox"/> 2	<input type="checkbox"/> 3	<input type="checkbox"/> 4

j) Improved physical comfort of waiting facilities at stations/stops (e.g. provision of shelters/seating)	<input type="checkbox"/> 1	<input type="checkbox"/> 2	<input type="checkbox"/> 3	<input type="checkbox"/> 4
k) Increased physical comfort on public transport (e.g. comfort of seating/temperature)	<input type="checkbox"/> 1	<input type="checkbox"/> 2	<input type="checkbox"/> 3	<input type="checkbox"/> 4
l) Better offers on public transport tickets (e.g. discounts for specific types of people and/or times of travel)	<input type="checkbox"/> 1	<input type="checkbox"/> 2	<input type="checkbox"/> 3	<input type="checkbox"/> 4
m) More ticketing options for public transport (e.g. smart cards/ integrated ticketing/ online payments)	<input type="checkbox"/> 1	<input type="checkbox"/> 2	<input type="checkbox"/> 3	<input type="checkbox"/> 4
n) Cheaper fares for public transport	<input type="checkbox"/> 1	<input type="checkbox"/> 2	<input type="checkbox"/> 3	<input type="checkbox"/> 4
o) Season ticket loans for public transport	<input type="checkbox"/> 1	<input type="checkbox"/> 2	<input type="checkbox"/> 3	<input type="checkbox"/> 4
p) Free parking at Park & Ride sites	<input type="checkbox"/> 1	<input type="checkbox"/> 2	<input type="checkbox"/> 3	<input type="checkbox"/> 4
q) More Park & Ride options	<input type="checkbox"/> 1	<input type="checkbox"/> 2	<input type="checkbox"/> 3	<input type="checkbox"/> 4
r) A Cycle scheme (like a season ticket loan but to buy a bicycle)	<input type="checkbox"/> 1	<input type="checkbox"/> 2	<input type="checkbox"/> 3	<input type="checkbox"/> 4
s) More/Improved cycle paths and cycle crossing facilities	<input type="checkbox"/> 1	<input type="checkbox"/> 2	<input type="checkbox"/> 3	<input type="checkbox"/> 4
t) More/improved cycle parking at stations/stops	<input type="checkbox"/> 1	<input type="checkbox"/> 2	<input type="checkbox"/> 3	<input type="checkbox"/> 4
u) More/Improved public cycle parking (e.g. more locations/ better security)	<input type="checkbox"/> 1	<input type="checkbox"/> 2	<input type="checkbox"/> 3	<input type="checkbox"/> 4
v) Improved quality of footpaths	<input type="checkbox"/> 1	<input type="checkbox"/> 2	<input type="checkbox"/> 3	<input type="checkbox"/> 4
w) More/Improved pedestrian crossing facilities	<input type="checkbox"/> 1	<input type="checkbox"/> 2	<input type="checkbox"/> 3	<input type="checkbox"/> 4
x) Improved public realm (e.g. more trees/planters, better footways/ cycleway surfacing)	<input type="checkbox"/> 1	<input type="checkbox"/> 2	<input type="checkbox"/> 3	<input type="checkbox"/> 4
y) Provision of cycling/walking route maps and wayfinding information	<input type="checkbox"/> 1	<input type="checkbox"/> 2	<input type="checkbox"/> 3	<input type="checkbox"/> 4
z) More/Improved facilities at your workplace for cyclists/pedestrians (e.g. showers/ storage/ changing facilities)	<input type="checkbox"/> 1	<input type="checkbox"/> 2	<input type="checkbox"/> 3	<input type="checkbox"/> 4
aa) Provision of travel planning advice (from experts visiting your child's school/your workplace)	<input type="checkbox"/> 1	<input type="checkbox"/> 2	<input type="checkbox"/> 3	<input type="checkbox"/> 4
bb) Introduction of a Workplace Parking Levy (e.g. being charged to use parking spaces at your place of work)	<input type="checkbox"/> 1	<input type="checkbox"/> 2	<input type="checkbox"/> 3	<input type="checkbox"/> 4
cc) Fewer free on-street parking spaces	<input type="checkbox"/> 1	<input type="checkbox"/> 2	<input type="checkbox"/> 3	<input type="checkbox"/> 4
dd) Pollution charging (a charge for using more polluting vehicles)	<input type="checkbox"/> 1	<input type="checkbox"/> 2	<input type="checkbox"/> 3	<input type="checkbox"/> 4
ee) A form of road charging (depending on level of congestion)	<input type="checkbox"/> 1	<input type="checkbox"/> 2	<input type="checkbox"/> 3	<input type="checkbox"/> 4
ff) Flexible working hours	<input type="checkbox"/> 1	<input type="checkbox"/> 2	<input type="checkbox"/> 3	<input type="checkbox"/> 4

**Q12.** [If Q4a=2 or Q4a=3 or Q4a=4] Is there anything else that could encourage or enable you to reduce your use of your own car/van, and use other modes of travel instead? \_\_\_\_\_

## Demographics

I'd like to take a few final details before we finish...

**D1.** What is your full home postcode?

Home postcode \_\_\_\_\_

1 Don't know/prefer not to say [Do NOT read out]

**D2.** Do you have any disabilities that affect the way you travel? (Please select all that apply) [Multiple response]

1 No [Single response]

2 Yes - Visual impairment

3 Yes - Mobility impairment

4 Yes - Hearing impairment

5 Yes - Mental health illness

6 Yes - Learning difficulty

7 Yes - Other, please specify \_\_\_\_\_

8 Don't know/prefer not to say [Do NOT read out]

**D3.** Would you be willing to participate in further research? If yes, we will need to take your contact details and will pass these on to the Greater Cambridge Partnership along with a subset of the data collected here today.

1 Yes

2 No

**D4.** Would you like to be entered into a prize draw for one of three chances to win £100 worth of high street shopping vouchers?

1 Yes

2 No

D5. Thank you very much for taking the time to talk to me today. Is there anything else that you would like to add before we finish? \_\_\_\_\_

D6. Finally, please may I take your contact details? We ask all participants for their contact details for our own back-checking purposes. However, we'll also need them if you indicated that you would like to be entered into the prize draw; that you would be willing to participate in further research; or, if you indicated that you do NOT want to participate in further research (so that we can ensure you don't get sent a similar survey, linked to this work, by the Greater Cambridge Partnership). Your contact details will be treated in confidence and used only for the purposes for which you have agreed.

<sub>1</sub> Yes

<sub>2</sub> No

D6a. [If D6=1] Record Respondent Details \_\_\_\_\_

D6b. [If D6=1] Respondent Name \_\_\_\_\_

D6c. [If D6=1] House Number/ Name \_\_\_\_\_

D6d. [If D6=1] Street Name \_\_\_\_\_

D6e. [If D6=1] Town \_\_\_\_\_

D6f. [If D6=1] County \_\_\_\_\_

D6g. [If D6=1] Best Contact Number \_\_\_\_\_

D6h. [If D6=1] Email \_\_\_\_\_

If you find you have any queries after we've finished you can contact the Greater Cambridge Partnership by telephone on 01223 699906. [Other contact methods are also available – see <https://www.greatercambridge.org.uk/contact-us/>.]

Thank you very much for taking the time to talk to me today. I have no further questions.

The SYSTRA logo is rendered in a bold, red, sans-serif typeface. The letters are thick and closely spaced, with a distinctive design where the 'S' and 'Y' are connected at the top, and the 'T' has a unique, slightly curved top bar.

This page is left blank intentionally.

## Our Big Conversation Campaign Analysis

This paper provides an overview of Our Big Conversation, a multi-channel marketing communications campaign between September and November 20 2017.

Please be aware that the data provided below is indicative and some sources are estimated, as detailed figures were not available for all sources.

Analysis is provided for different marketing communication techniques, including events, print materials, media coverage, advertising, partners' channels, social media and website.

If you have any questions on Our Big Conversations or the data below, please don't hesitate to contact us on: [contactus@greatercambridge.org.uk](mailto:contactus@greatercambridge.org.uk)

### Events

In total, there were 38 Our Big Conversation events for a wide range of stakeholders, including residents, employers, young people, commuters and councillors.

It is estimated that we spoke to around 3000 people directly during these events.

Type	Venue	Audience	Date	Estimated footfall	Public contact
City Council Staff Briefing	Guildhall Cambridge	Employers	25/09/2017	40	40

## Print materials

We distributed over 5000 leaflets and 800 feedback forms during the campaign period for Our Big Conversation. The collateral was used during events and also distributed by our partners.

To provide further information on the Greater Cambridge Partnership and our projects, an A4 leaflet was produced for the campaign for the following areas: city centre, east, north, south, west and cycling.

Feedback forms were also created to enable residents and businesses to provide constructive feedback at our events.

## Media coverage

To promote Our Big Conversation, the Greater Cambridge Partnership's communication team worked closely with the local media, arranging press interviews and producing press releases.

In total, there were 15 articles on Our Big Conversation in the local media. All our press releases are available to view on our website: <https://www.greatercambridge.org.uk/news/>

## Advertising

To raise general awareness and to target specific stakeholders, advertising was used during Our Big Conversation. This included promoting a number of events using Facebook and adverts placed in the local media.

We also arranged a sponsorship deal with Cambridge United to help reach a wider audience. This included adverts placed in match day programmes and posts on their social media channels.

Date of advert	Length of advert	Channel	Type	Size	Page	Distribution	Reach

## Partners' Channels

Cambridge and South Cambridgeshire has a number of vibrant business, charitable and community networks. They helped us promote Our Big Conversation to their members, in the form of e-newsletters, blogs and articles.

Our local authority and business partners also promoted the campaign using their existing channels, including residents' magazines and e-newsletters.

It is estimated that through our partners' channels we reached over 500,000 people.

## Social media

The Greater Cambridge Partnership uses social media to communicate to its stakeholders. It has three social media accounts on [Twitter](#), [Facebook](#) and [Linked In](#).

During the campaign, we used the hashtag #OurBigConversation. On Twitter alone, the hashtag was used in 124 tweets, generating 158 retweets and 101 likes.

The table below provides a summary of social media from GCP channels and does not take into account social media generated by partners or other users.

Channel	Total number of posts	Reach	Impressions	Reactions	Engagement	Views
Facebook	31	11418	20335	117		
Twitter	56		112665		2449	
Linked In	12		1087			
YouTube	2					432
Total	101		137085			

## Greater Cambridge Partnership Website

The GCP ([greatercambridge.org.uk](http://greatercambridge.org.uk)) launched a new website in July 2017. The campaign used the new website to provide general information, regular news updates and promote events.

In total, there were 37 pages on the GCP website, generating a total of 2384 unique page views.

# Cambridgeshire Travel Survey Presentation to the Greater Cambridge Partnership Joint Assembly

Page 327

**SYSTRA**

# Contents

1. Study Background

2. Methodology

Page 328  
3. Key Findings

- An opportunity for modal shift away from car/van
- Recent changes in transport modes
- How to encourage modal shift

# Study Background

Growing and sharing prosperity

- aims to develop a sustainable transport network for Greater Cambridge
- keep people, business and ideas connected as the population grows

- independent research consultancy
- specialising in transport

Page 329

## Research with Cambridge and South Cambridgeshire residents

- to better understand travel behaviour, and reasons for travel choices
- to support the design of a transport strategy to:
  - reduce congestion
  - encourage modal shift
  - shape investment from 2020 onwards

# Methodology

- 1,021 computer aided telephone interviews (CATI)
- September-October 2017
- Telephone numbers compiled and dialled at random
- Demographic profiling to target a representative sample in terms of district, gender and age
- Prize draw incentive
- Weighted and unweighted data provided

# Data Weighting

- Data weighting adjusts the 'weight' given to different responses so that, overall, the results better reflect the views/behaviours of the population of interest
- Survey: 42% Cambridge, 58% South Cambridgeshire
- ONS Population Estimates for mid-2016: 47% Cambridge, 53% South Cambridgeshire
- Over sampled South Cambridgeshire
- Weightings are applied which bring the proportions back in line with the population
- Segmentation analysis is also undertaken to look at sub-groups of the population and how they may differ

	Achieved Sample (N)	Weighted Sample (N)
<b>District</b>		
Cambridge	424	481
South Cambridgeshire	597	540
<b>Gender</b>		
Male	414	514
Female	606	506
<b>Age</b>		
16-24 years old	127	181
25-49 years old	366	434
50-64 years old	255	208
65+ years old	270	196

# Questionnaire

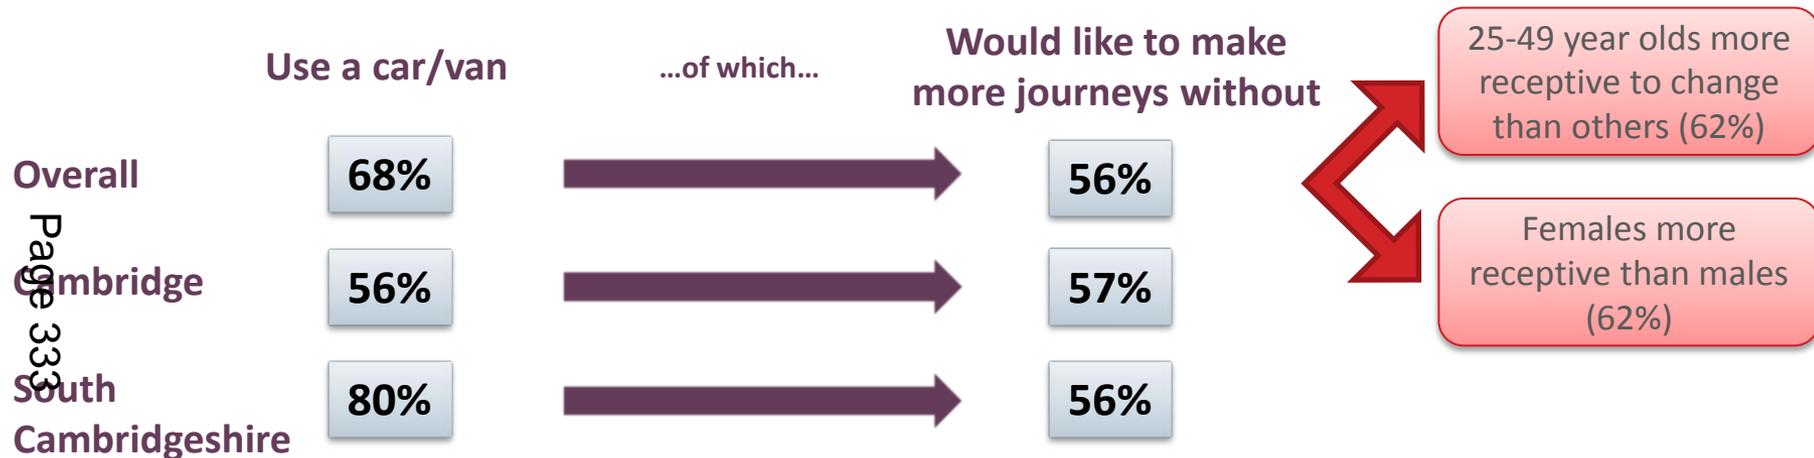

- The survey was designed to capture information about:

- respondents' demographics
- current travel behaviour in and around Cambridge

- Page 332
- reasons for travel choices
  - alternative travel modes
  - the likelihood various potential initiatives might have on their travel choices

# An opportunity for modal shift away from car/van

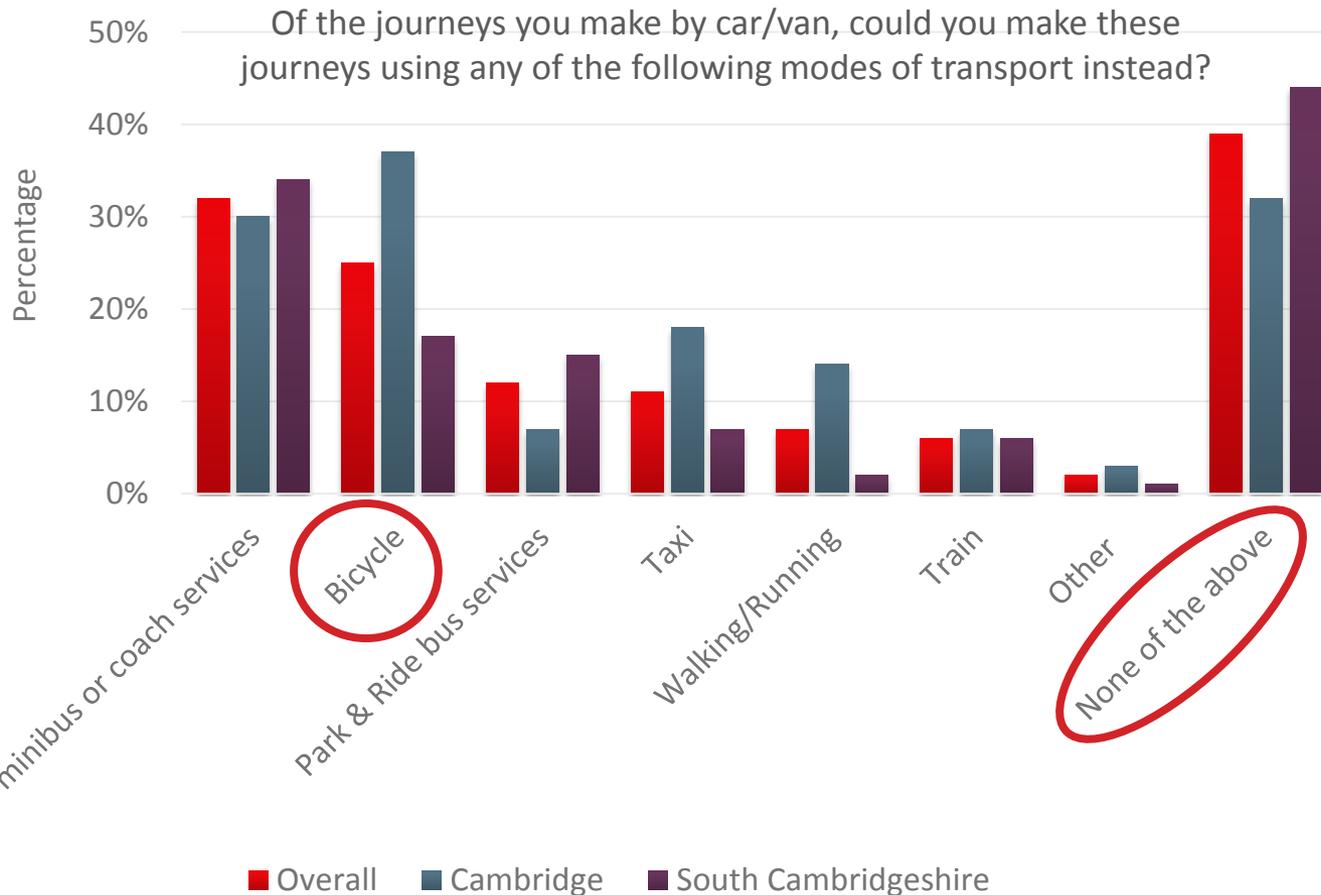

There is both potential and appetite for modal shift among car/van drivers

- ONS Population estimates for mid 2016 suggest there are 236,232 people aged 16+ years old in Cambridge and South Cambridgeshire
- Results suggest potential for at least 89,957 less car/van journeys

# An opportunity for modal shift away from car/van

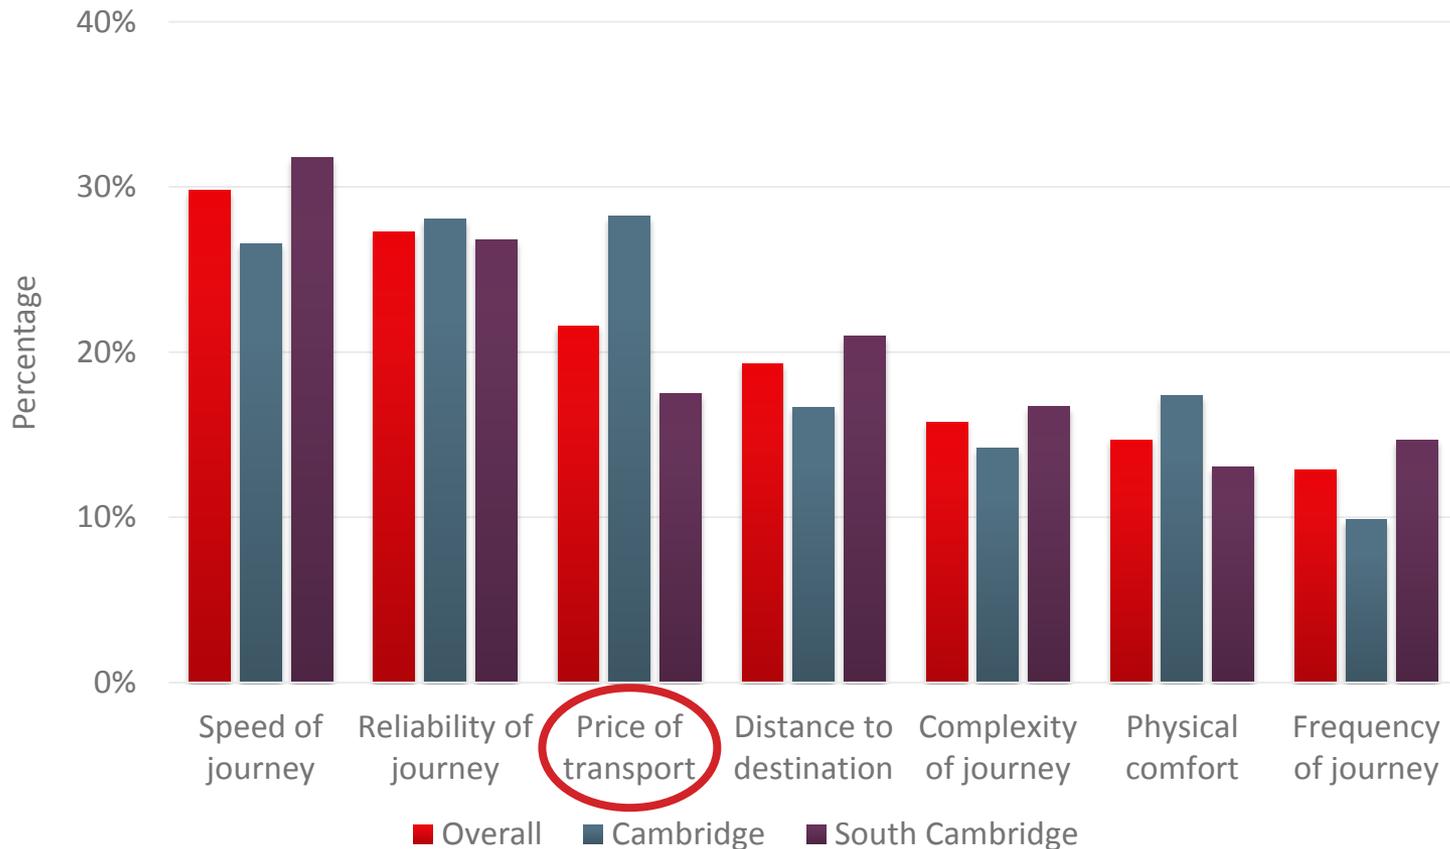

Bus, minibus and coach services, and cycling, were the most likely alternative to car/van

# An opportunity for modal shift away from car/van

The speed and reliability of alternative modes were the most common reasons for not using alternative modes

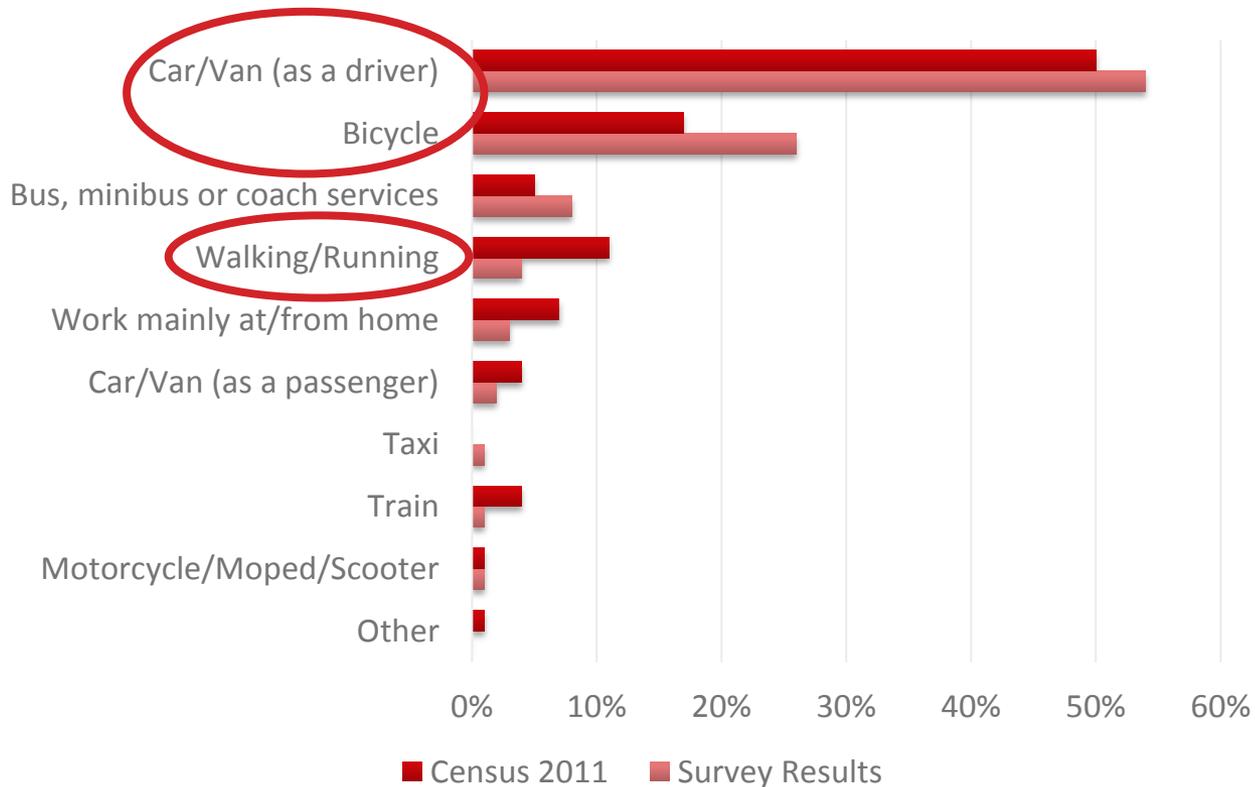

Page 335

# Recent changes in transport modes 2017 survey compared to 2011 Census

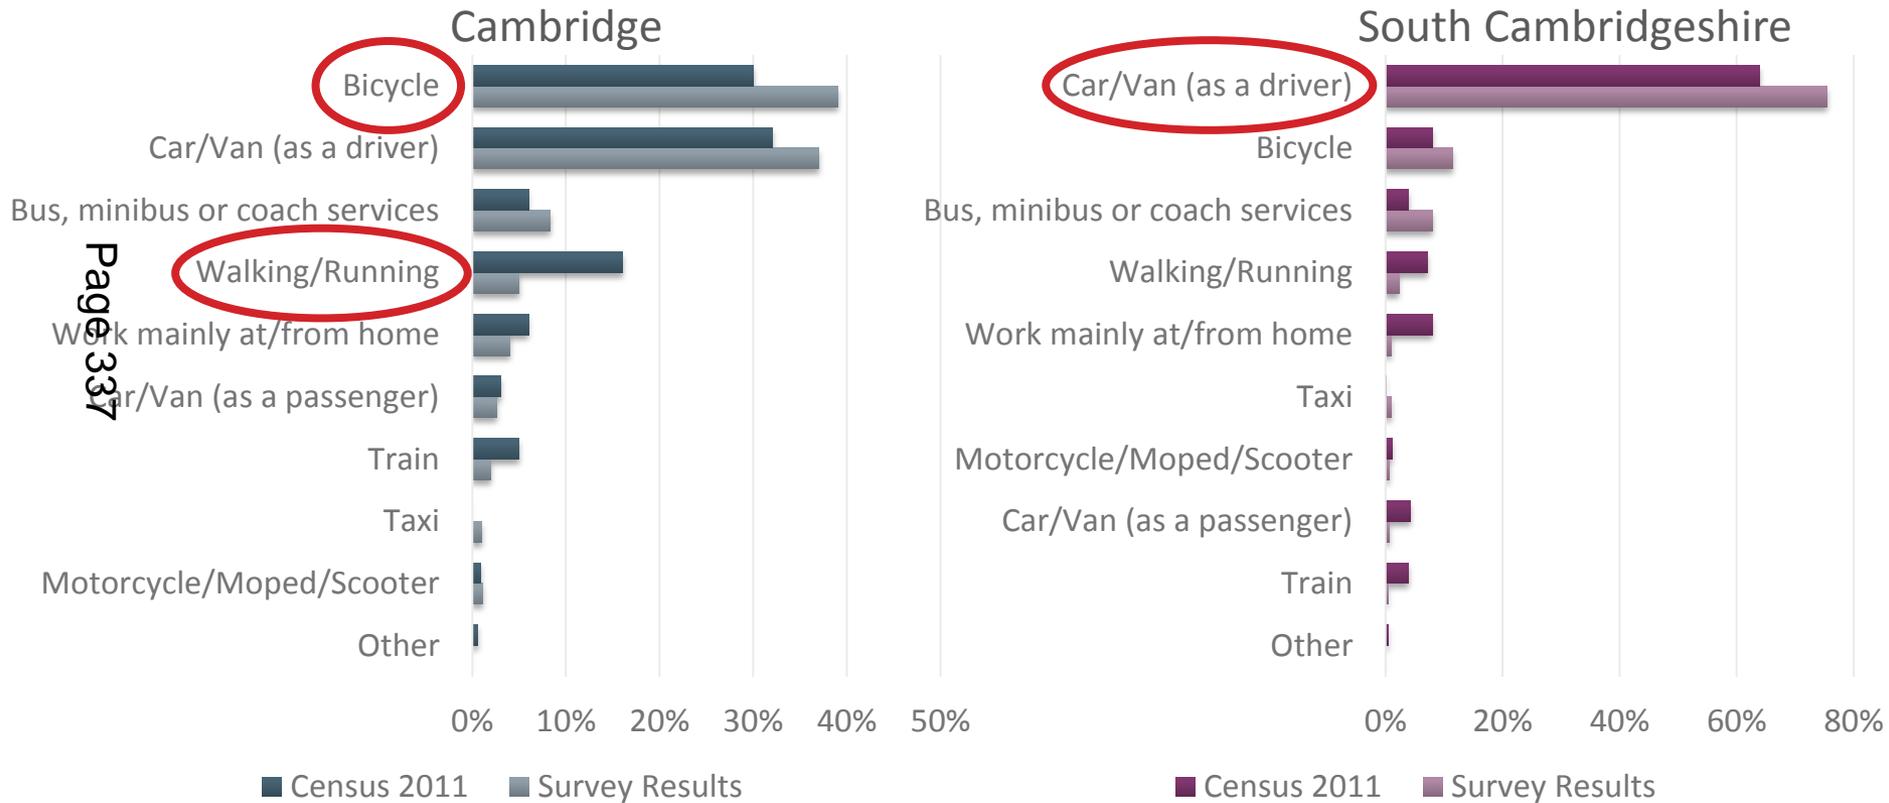

Respondents who stated that they made commuting journeys to/from work were asked to identify the mode of transport they usually use for these specific journeys. This question was also asked in the 2011 Census

Page 336

# Recent changes in transport modes 2017 survey compared to 2011 Census

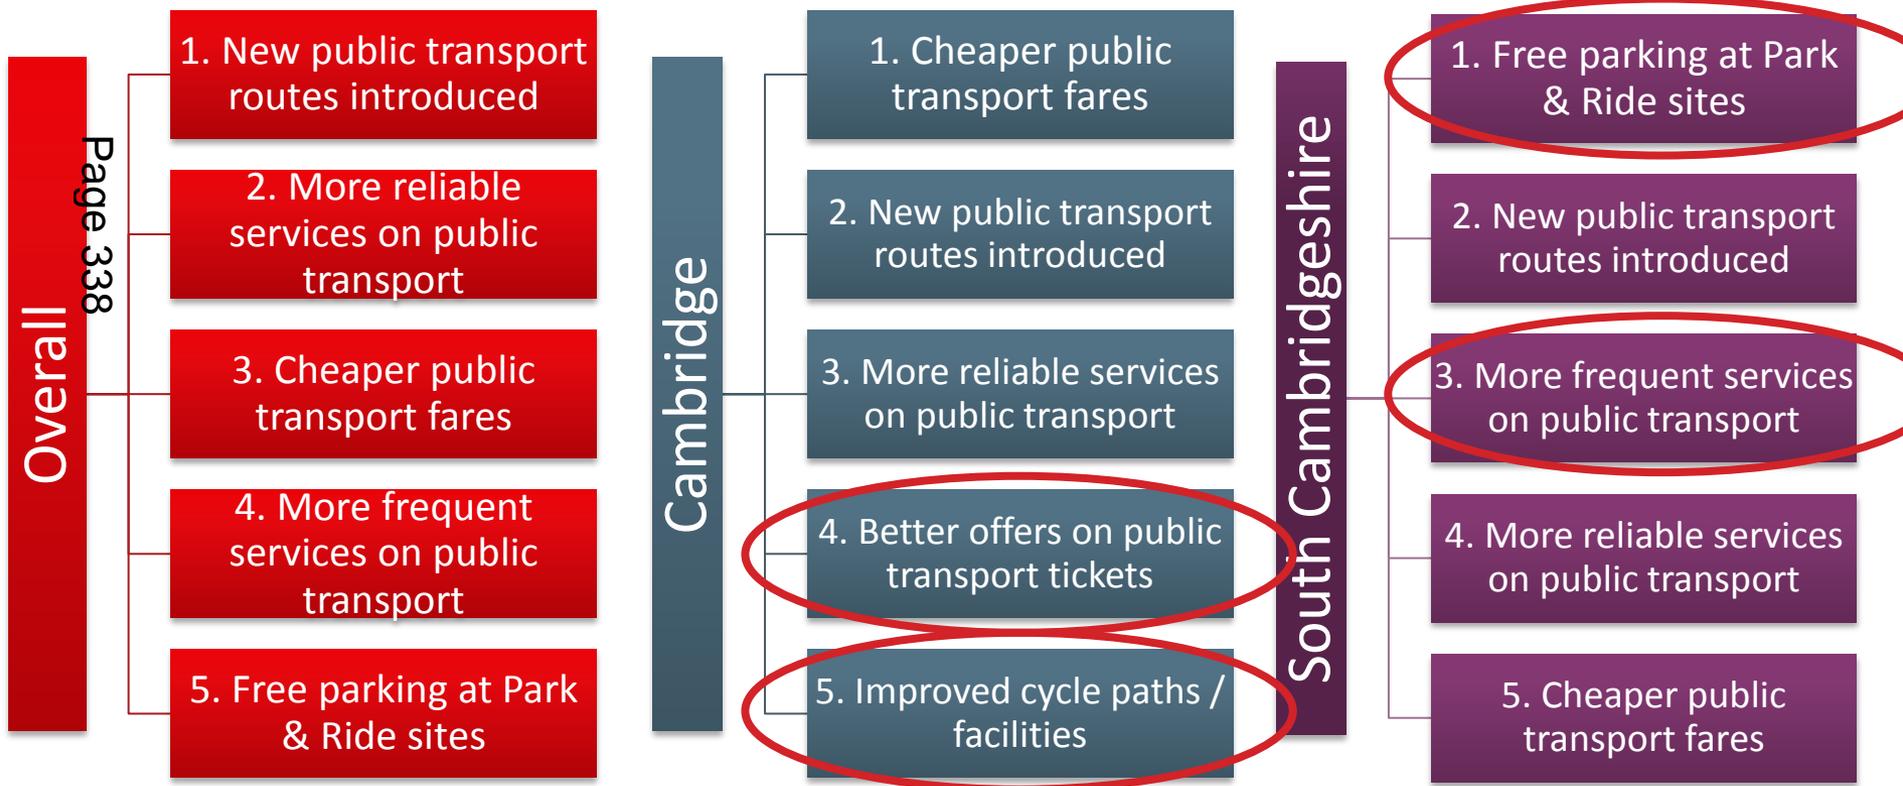

Similar patterns are seen in both Cambridge and South Cambridgeshire

# How to encourage modal shift

## Top 5 incentives to encourage modal shift, overall and by district

Those who currently make journeys by car/van were asked to state to what extent different initiatives would encourage them to travel by alternative modes

# How to encourage modal shift

## Bottom 5 incentives to encourage modal shift, overall and by district

The 5 initiatives least likely to encourage modal shift, overall and by district.

Carry Stephenson

Liz Boast

Sophie Murphy

# Agenda Item 11

**GREATER  
CAMBRIDGE  
PARTNERSHIP**

Growing and sharing prosperity

Delivering our City Deal

**Report to:** Greater Cambridge Partnership Executive Board

08 February 2018

**Lead officer:** Chris Tunstall – GCP Interim Director of Transport

## **Rural Travel Hubs**

### **1. Purpose**

- 1.1. To present a feasibility report on the development of Rural Travel Hubs in South Cambridgeshire.
- 1.2. To seek approval to proceed to phase two of the project. Phase two will involve the preparation of full business cases for the pilot sites, a detailed analysis of planning considerations, refined costings of construction and an outline of the evaluation methods to review the success of the pilots.
- 1.3. This supports the Greater Cambridge Partnership's transport vision of 'creating better and greener transport networks, connecting people to homes, jobs, study and opportunity'.

### **2. Recommendations**

It is recommended that the Executive Board;

- 2.1. Note and take into consideration the results of the feasibility report, future parish consultation with residents, local knowledge and planning considerations to approve Oakington and Sawston as pilots to be taken into Phase 2 as part of the Rural Travel Hubs project.
- 2.2. Agree that in respect of Whittlesford:
  - a) A Master Transport Planning exercise to be undertaken at a cost of £50,000 which can be met out of existing funding,
  - b) That a contribution of £70,000 be made for the provision of additional cycle parking for 200 bikes.
- 2.3. Note that the three villages in the above recommendations would form part of the first wave of Rural Travel Hubs. Based on the evaluation of the success of these pilots, further waves of Rural Travel Hubs could be investigated in the future.

### **3. Officer comment on technical issues raised at Joint Assembly**

- 3.1 A question was raised as to why the feasibility report gave the impression of a low confidence in the success of the proposals by the consultant.

Officers confirmed that the feasibility report was to consider the concept of a Rural Travel Hub, and as such represents very high-level recommendations. Phase 2 of the Rural Travel Hubs project includes the development of business cases and will therefore provide more certainty of the potential success of the Pilot Rural Travel Hubs.

- 3.2 There was a specific concern raised about Whittlesford and that the travel hub would act as a free car park for the railway station. A similar concern was raised regarding Sawston and that for both villages the travel hubs would not benefit residents directly, effectively becoming railway station car park extensions with increased number of cars in villages and thus potentially being at odds with objectives and priorities of the GCP.
- 3.3. The officer response to concerns about Whittlesford was that there is going to be a Master Transport Planning exercise that will take a holistic look at the issues surrounding the area to develop a strategy that will most effectively resolve any issues identified (see section 4.7). In respect of the point raised for Sawston, it was pointed out that the site was only one possibility. The engagement with local residents as part of Phase 2 of the project will provide officers with a detailed understanding of how a travel hub should be integrated into the village to benefit residents.

#### **4. Key issues and considerations**

- 4.1. In March 2017, the Greater Cambridge Partnership (GCP) Executive Board approved £100k to progress a feasibility study into the potential of RTHs.
- 4.2. Skanska were appointed as the consultants to undertake most of the feasibility study under a framework contract already held with the County Council. The feasibility work commenced in June 2017.
- 4.3. The key objectives for Skanska and the Rural Travel Hubs feasibility study were:
- a. To provide a community-led understanding of what a Rural Travel Hub is and their purpose
  - b. Identification of rural communities' travel connections to Cambridge City
  - c. Develop an outline specification and criteria for Rural Travel Hubs based on community views
  - d. Identify areas within South Cambridgeshire that may benefit from the provision of a Rural Travel Hub
  - e. Provide a recommendation to establish at least two sites that could be used as a pilot study for Rural Travel Hubs
  - f. Consider the high-level planning issues that would be relevant to any planning application.
- 4.4. Section 11 of the feasibility report (provided in **Appendix 1**) details the site prioritisation methodology and nine criteria used to rank the sites. Taking all factors into consideration, Oakington (adjacent the Cambridge Guided Busway), and Whittlesford are identified as the top two sites. A further eight sites are listed in order of their criteria based score.
- Oakington**
- 4.5. The Oakington site is owned by Cambridgeshire County Council. It is anticipated that this would enable quicker land acquisition discussions and therefore a faster delivery of the pilot. It is also in the green belt; therefore work will need to be done to demonstrate the very special circumstances which justify a Green Belt location such as more evidence to demonstrate the benefits of the sites and local transport needs.

### **Whittlesford**

- 4.6. The Whittlesford site is in the countryside outside the village framework; therefore consideration will need to be given to safeguard the rural character. During the course of this research it has been agreed that a master planning exercise will take place for Whittlesford station and its surrounding area, including the three adjacent science hubs. This will involve taking a holistic look at the issues and opportunities whilst involving all the stakeholders, landowners, neighbourhood plan group and Parish Council to develop a plan for the whole area.
- 4.7. The Master Transport Planning exercise will take into consideration the Cambridgeshire rail corridor study and any ongoing need for the rural hub. The cost of the study is anticipated to be £50,000 and will take 6 to 8 weeks to complete. It is envisaged that the results will be available early to mid-March 2018. The brief is provided in **Appendix 2**.
- 4.8. We have been approached by Greater Anglia regarding the opportunity to provide a significant number of secure cycle spaces at the Station. DfT currently have grant funding available for this type of station enhancement. The proposal is to utilise an existing under-utilised area of station land to provide for a mix of secure and non-secure, well lit, CCTV monitored cycle parking area for 200 bikes. The cost of which is estimated to be £700,000. The conditions of the grant funding is that a 10% third party contribution must be obtained and Greater Anglia have been in discussion with us with regard to this contribution of £70k. This aligns well with our mode shift objective and is recommended for support.

### **Sawston**

- 4.9. Given that there could be delays, for planning or master planning reasons, in bringing forward either of the top two sites. It may be prudent to consider a third pilot at Sawston (a very close third ranked hub) to safeguard against this. The proposed location at Sawston will need to be considered in light of the ongoing projects including delivering improvements to the South Eastern Corridor (A1307), which also has the potential for the development of a park and ride at Linton, and aspirations of the Parish. This can all be taken into consideration if it is agreed this site moves into phase two.
- 4.10. An initial costing for each of the sites has been included in the feasibility report. It should be noted that whilst these costings may be high they could well be reduced depending on specification and exact designs. More detailed costings would be developed in phase two of the project if approved by the Executive Board in February.
- 4.11. The report has undertaken initial assessment of the benefits and disbenefits of Rural Travel Hubs in 'Section 6' of the feasibility report. This will inform the development of the business cases going forward. At this stage it is anticipated that further work to refine current designs to facilitate the preparation of business cases can be met within current budget allocation. The budget will be monitored carefully going forward. Any likelihood of overspend will be reported back to the Board.

## **5. Options**

- 5.1. Taking into consideration the results of the feasibility report, parish consultation, local knowledge and planning considerations, it is the officers' view that Rural travel Hubs be explored further at Oakington, Whittlesford (as part of the Transport Master Planning exercise) and Sawston by developing full business cases for each site.

## **6. Next steps and milestones**

- 6.1. The GCP Executive Board in February 2018 will be recommended to approve Oakington, Whittlesford (as part of the Transport Master Planning exercise) and Sawston as the three pilot sites, to progress to phase two of this project.
- 6.2. Phase two will include the preparation of full business cases for Oakington and Sawston sites, developed with the local communities, Parish Councils and local Members to ensure proposals meet local needs. They will address planning considerations such as green belt, design, access and conservation, refine the costs and outline the monitoring and evaluation methods that will be used to review the success of the pilots.
- 6.3. Following local engagement the business cases will be updated accordingly and presented to the Assembly and Board in late 2018 when the Board will be asked to approve further funding for the development of the sites.

## **7. Implications**

### **7.1. Financial and other resources**

The Scheme development is funded by Greater Cambridge Partnership through City Deal funding. The initial allocation of £100k by the Executive Board in March 2017 for this project should be sufficient to complete Phase2.

### **7.2. Legal**

No significant legal implications have been identified at this stage although they may emerge as the project moves towards the statutory process stage.

### **7.3. Staffing**

Project Management is undertaken by officers of the Greater Cambridge Partnership. Consultants have yet to be appointed to complete Phase2 of the project, although it is likely it will be Skanska.

### **7.4. Risk management**

A full project risk register forms part of the Project Plan.

### **7.5. Equality and diversity**

There are no equality or diversity implications in this report.

### **7.6. Climate change and environmental**

The proposed measures have the potential to reduce congestion and improve air quality in the longer term through encouraging a shift towards sustainable transport modes.

### **7.7. Consultation and communication**

Officers anticipate engagement with the statutory and local stakeholders through the future design phases of the scheme.

- Appendix F – Prioritisation Matrix
- Appendix G – Cost Estimates
- Appendix H – Sites Location Plan
- Appendix I – National and Local Planning Policies to consider
- Appendix J – Traffic Flows

## Executive Summary

Cambridge and South Cambridgeshire continue to grow both geographically and economically. With the predicted level of growth it is deemed unsustainable for the car to continue as a primary transport mode into Cambridge city. The demand for a frequent and reliable transport system is increasing, especially from the rural locations surrounding the city. The rural communities in South Cambridgeshire represent a proportion of society that should be able to take full advantage of the transport networks available, whether they are bus, walking or cycling networks, and not have to rely on car journeys to access the city.

Skanska has been commissioned by The Greater Cambridge Partnership and South Cambridgeshire District Council to prepare a feasibility study into the potential for Rural Travel Hubs to be developed within South Cambridgeshire.

The Rural Travel Hub concept seeks to increase bus and cycle patronage into Cambridge from the outlying rural areas in order to reduce the number of car journeys into the city.

Through a consultation and engagement process the term 'Rural Travel Hub' has been defined as:

***'a transport facility that serves as an interchange, close to existing transport corridors (that are served by a reliable and relatively frequent public transport service), where residents in rural areas can walk, cycle or drive to and continue their onward journey using a sustainable mode of travel'.***

The consultation and engagement process also assisted with the identification of services, infrastructure and facilities that could be provided at the hub location.

There are no existing designated Rural Travel Hubs in the South Cambridgeshire District. However, an existing transport facility at Swavesey has been reviewed as part of the feasibility study. The Swavesey Guided Busway Stop has evolved into something akin to a Rural Travel Hub, and perhaps best represents what a hub may look like and consequently was used as a case study.

A detailed review of national, regional and local transport policy applicable to rural travel and the Rural Travel Hub concept was undertaken. This review concluded that the development of infrastructure similar to that of Rural Travel Hubs, should be supported at all levels.

A district-wide review resulted in the identification of 10 parishes that could be considered for a Rural Travel Hub in South Cambridgeshire.

The report has considered the baseline situation in South Cambridgeshire in terms of typical movements of people and the mode of transport that they currently use. This has shown that, as may be expected, a number of people living in the vicinity of the potential hub sites work in Cambridge, and as a result of this are making journeys into Cambridge on a regular basis.

The feasibility study concluded that the operation of Rural Travel Hubs in South Cambridgeshire is potentially viable and that they are likely to be supported by local communities, serving to encourage more use of sustainable travel for journeys into Cambridge from outlying parishes.

An appraisal process was undertaken which reviewed each of the 10 parishes against identified factors, considering the opportunities and constraints at each. Adopting this approach a priority list was established to aid the identification of the two parishes that could progressed as pilot sites as detailed below:

- a) Oakington Guided Busway Stop
- b) Whittlesford Railway Station

Subject to the approval of the Greater Cambridge Partnership's Assembly and Board the two identified pilot sites should be taken forward to preliminary design, local consultation and planning permission/consent, and (subject to approval) construction.

---

It is recommended that the two pilot sites are monitored to establish usage patterns. The results of this monitoring process would then dictate whether further Rural Travel Hubs should be provided throughout South Cambridgeshire.

## 1.0 Introduction

### 1.1 Background

Cambridge is a city that has experienced huge growth since the 1960s in technology, innovation and life sciences to become the UK's leading city in these areas. This growth has made Cambridge an ideal place for foreign investment into the UK economy. This growth is now contributing to a shortage of housing and a transport network that grows more congested each year.

The Greater Cambridge Partnership (GCP) is a partnership between Central Government, Council leaders, businesses and the University of Cambridge, which aims to secure hundreds of millions of pounds in the years leading up to 2031. Part of the investment plan of the GCP is focussed on transport. The importance of transport has been recognised as a key factor in the continued success of the Cambridge Phenomenon and economic success in this area.

The GCP's vision is "Working together to grow and share prosperity and improve quality of life, now and in the future" and its transport ambition is "Creating better and greener transport networks, connecting people to homes, jobs, study and opportunity".

As Cambridge continues to grow both geographically and economically the need to access the city on frequent and reliable transport is increasing, especially from the rural locations surrounding Cambridge. There is a need for the people living in these rural locations to have increased access to the existing and planned transport services into the city centre. The rural communities in South Cambridgeshire represent a proportion of society that should be able to take full advantage of the public transport networks available, whether they are bus, walking or cycling networks, and not have to rely on car journeys to access the city.

"In South Cambridgeshire, the level of car traffic generated by travel to work trips grew by 9.8%, but the proportion of employed residents of the district who drove to work dropped from 62.7% to 60.2%. For stability in car trips to be seen in the period 2031 with the population growth envisaged in the Local Plans, this proportion would need to fall to around 47%" (Transport Strategy for Cambridge and South Cambridgeshire, 2014).

This project has been funded after a decision made by the GCP Executive Board to progress a feasibility study of Rural Travel Hubs in South Cambridgeshire. In response to a letter sent to all South Cambridgeshire District Council (SCDC) Parishes in 2016 from the SCDC Portfolio Holder for the GCP, six parishes of South Cambridgeshire have put forward their interest in being involved with this project.

Swavesey is an example of an existing project that has seen the development of a 'travel hub' aiming to increase bus and cycle patronage, whilst reducing the number of people travelling into Cambridge by car. Details from the Swavesey project will be used within the study to determine the benefits and physical aspects of a Rural Travel Hub.

The project will feed into the wider objectives of the Transport Strategy for Cambridge and South Cambridgeshire (2014) to:

- Enhance accessibility to, from and within Cambridge and South Cambridgeshire
- Ensure good transport links between new and existing communities
- Prioritise sustainable alternatives to the private car and reduce the impacts of congestion on sustainable modes of transport;
- Ensure the strategy encourages healthy and active travel, supporting improved well-being.

The Rural Travel Hubs project will need to inter-relate with other local transport projects and their aims. These include the following:

#### **City Access – Greater Cambridge Partnership**

City Access is a package of eight measures to tackle congestion within Cambridge by the creation of a transport system that meets the needs of our growing, vibrant city. It plans to achieve a reduction in peak-time traffic levels in Cambridge by 10-15% by 2031.

It aims to help more people get into, out of and around the city by sustainable means, offer better alternatives to travel by car and boost economic growth and quality of life.

The City Access package of eight measures are:

- pedestrian and cycling infrastructure provision
- Improved public space and air quality
- better bus services and expanded use of Park and Ride
- travel planning
- smart technology
- traffic management
- workplace parking levy
- on-street parking management (including Controlled Parking Zones)

### **Greenways – Greater Cambridge Partnership**

The Greenways project aims to establish a high-quality network of 12 separate routes into Cambridge from surrounding towns and villages, from approximately five to ten miles away. They will primarily be commuter cycle paths, but with additional benefits for pedestrians, horse riders and leisure.

A 'Greenway' will be an attractive route segregated from traffic or on quiet roads. The aim is to increase levels of cycling and walking, to reduce congestion as the city grows and to improve the health of the population. Parts of each route exist already, but some may need significant improvement or have missing links.

### **Cambourne to Cambridge Better Bus Journeys – Greater Cambridge Partnership**

The Cambourne to Cambridge scheme aims to deliver improved, faster and more reliable bus services, together with high quality cycling and walking facilities and a new Park & Ride site, for people travelling into Cambridge from towns and villages to the west.

The project will provide improved public transport links - connecting people to places of employment, study and key services - and help existing and new communities along the A428 grow sustainably in the coming years.

Between now and 2031, 8,800 new homes and 15,000 new jobs are planned between Cambridge and St Neots along this route as part of the Local Plans, with 3,500 more houses to the east of St Neots due by 2036.

By providing new travel choices, and as an alternative to the car, the Cambourne to Cambridge scheme will help manage growing congestion on the A428 and ensure people have good access to opportunities in the Cambridge area.

The scheme is ear-marked for completion within the next five to 10 years.

### **Cambridge South East Travel Study – Greater Cambridge Partnership**

The Cambridge South East Travel Study aims to provide better bus, walking and cycling options for commuters that currently travel along the A1307, linking communities and employment sites between Haverhill and Cambridge.

The preferred options include:

- improved public transport corridors along the A1307 in Linton as well as improved non-motorised user routes between Babraham and Cambridge
- a public transport corridor from Babraham Road Park & Ride to the Cambridge Biomedical Campus
- new Park & Ride site near the A11
- high-quality cycle routes

- safe walking routes
- road safety improvements between Horseheath and Linton

### **Western Orbital – Greater Cambridge Partnership**

A Western Orbital would provide a fast and reliable bus link near to or on the M11 between major housing sites and the big employment areas avoiding the busy city centre. These employment sites include: Cambridge Biomedical Campus and the West Cambridge site as well as the North West Cambridge site.

The Western Orbital could turn a section of the M11 into a three-lane 'smart motorway', which could ensure better bus journeys between Cambourne and Addenbrooke's, which could take under half an hour on a traffic-free route.

### **A10 Royston to Cambridge Foot & Cycleway – Greater Cambridge Partnership**

The A10 Foot and Cycleway is a shared vision of local residents, councillors, campaigners and project officers alike.

The aim is to ultimately see a high quality, consistent foot and cycle link extend from Cambridge all the way through to Royston, aligning with the A10 route.

The Greater Cambridge Partnership has overseen the creation of a local link within this vision that links Frog End to Melbourn via a foot and cycleway.

Following the resolutions of the Executive Board on Wednesday 22<sup>nd</sup> November, it has been asked that Cambridgeshire and Hertfordshire County Councils undertake a joint study for the completion of the final stretch of the A10 Royston to Cambridge pedestrian and cycle route, to feed into the GCP's future investment strategy prioritisation process.

## **1.2 Purpose**

The population of South Cambridgeshire in 2001 was approximately 130,000 which grew to just under 150,000 in 2011 and is estimated to reach over 180,000 by 2031.

The number of dwellings in South Cambridgeshire in 2001 was 53,600 growing to 61,700 in 2011. Significant growth is predicted with the number of dwellings expected to reach 80,600 by 2031 representing a 35% increase in the number of dwellings since 2001.

With this level of growth in South Cambridgeshire it is unsustainable for the car to continue as a primary transport mode into Cambridge City. The residents of South Cambridgeshire should have easy access to the transport networks available into the city with some communities residing within a few miles but being served poorly by the existing public transport, cycling and walking networks.

The purpose of this study is to take a community-led approach to determine what a Rural Travel Hub is and determine possible locations that would maximise the benefits seen by rural communities in South Cambridgeshire. The study will establish the needs of local communities when determining these locations.

The study will ensure that any recommended Rural Travel Hubs will provide rural communities with improved access to jobs and services in and around Cambridge whilst considering the impacts of localised motor traffic resulting from use of the hubs.

The study will provide criteria to establish feasibility and prioritisation of Rural Travel Hubs within South Cambridgeshire that would benefit from further funding and establish a case for project development. The study will be used to inform a report that will go to the Executive Board for a recommendation to progress the project to implementation.

## **1.3 Study Objectives**

The following objectives for this feasibility study will help to achieve the aim of the City Access Project, and therefore the Greater Cambridge Partnership, of *'making it easier to travel in, out and around Cambridge and*

*South Cambridgeshire by public transport, cycle or on foot, and reduce and maintain lower traffic levels to ease congestion’.*

- a) To provide a community-led understanding of what a Rural Travel Hub is and their purpose.
- b) Identification of rural communities’ travel connections to Cambridge.
- c) Develop an outline specification and criteria for Rural Travel Hubs based on community views.
- d) Identify locations within South Cambridgeshire that may benefit from the provision of a Rural Travel Hub by undertaking a district-wide review.
- e) Provide a recommendation to establish at least two sites that could be used as a pilot study for Rural Travel Hubs (RTH).
- f) Consider the high-level planning issues that would be relevant to any planning application.

## 1.4 Study Outcomes

The principal outcomes of the study include:

- A clearer understanding of the community view of benefits and dis-benefits of Rural Travel Hubs.
- A number of options with high level costs of the possible locations and layouts of Rural Travel Hubs that will suit the different geographical locations of South Cambridgeshire.
- Understand localised impacts of motor traffic on rural areas resulting from Rural Travel Hub usage.
- Recommendations of suitable areas within South Cambridgeshire that would benefit from further investigation of Rural Travel Hubs.

## 1.5 Methodology

This feasibility study will be undertaken in the following stages:

- a) Undertake a detailed review of pertinent policies and guidance related to Rural Travel Hubs (to include sustainable travel, active travel and public transport), assessing the relevance of Rural Travel Hubs and their compliance with governmental and societal aspirations and targets.
- b) Carry out a baseline review of the transportation and socio-economic characteristics of the South Cambridgeshire District Council Area using 2011 Census data.
- c) Undertake a case-study of the informal travel hub that has developed at the Swavesey guided busway stop, including user counts and a questionnaire survey.
- d) Hold a community engagement event to obtain local feedback on the Rural Travel Hub concept, establish a definition of what ‘Rural Travel Hubs’ are and their objective.
- e) Determine the benefits and dis-benefits of Rural Travel Hubs.
- f) Identify rural communities that would most benefit from a Rural Travel Hub through review of existing public transport provision.
- g) Undertake a detailed appraisal of all 10 potential hub sites. This includes the 6 sites identified following a 2016 consultation as detailed in section 3.0, considering:
  - Proximity to existing public transport network (bus and/or rail).
  - Proximity to designated cycle routes, other major Non-Motorised User (NMU) routes and any planned schemes (including Greenways).
  - Proximity to intended users.
  - Review of Public Transport Service levels (e.g. frequency of buses/trains).
  - Access to and from the sites (for both car drivers and NMUs).
  - Future development in the locality which could increase demand.
  - Planned infrastructure improvements nearby.

- Availability and suitability of land.
  - Review local census data to better understand the local demographic and travel patterns.
  - The need for public transport improvements to service the sites, including increased frequency & capacity.
  - The attractiveness of the site and NMU routes to it.
- h) Propose appropriate facilities for each site including:
- Car parking.
  - Access for both vehicles and NMUs (including availability of suitable NMU routes to the hubs).
  - Cycle parking/security (including cycle lockers).
  - Bus stop provision.
  - Drop-off provision.
  - Bus shelters.
  - Public information and Real Time Information.
  - Lighting (possibly low level in rural locations).
- i) Calculate high level construction cost estimates for each site (excluding land costs).
- j) Undertake site visits, preliminary measurements and site photographs as required.
- k) Score sites and rank in priority order to identify the two sites most suitable for pilot schemes. Scoring will consider:
- Population served.
  - Frequency of bus and rail services.
  - Cost of travel.
  - Car journeys saved.
  - Proximity to a suitable cycleway.
  - Land availability and suitability.
  - Site access.
  - Proximity to an existing Park & Ride site.
  - Cost per space.
- l) Prepare conceptual layouts for each site showing access arrangements for both car user and NMUs.
- m) Conclusion
- n) Recommendations

## 1.6 Study Outputs

A feasibility report on the definition of Rural Travel Hubs, defining the opportunities and risks they could provide within South Cambridgeshire with recommendations of sites for a pilot scheme.

The report considers the potential options for travel hub provision including presenting a selection of types, facilities and locations which might be suitable, and outlining the benefits and potential issues associated with each. Consideration will also be given to the overall scheme benefits and factors such as budgetary constraints.

## 2.0 Policy & Guidance Review

This section provides an overview of the various national and local transport policies pertinent to the concept of a Rural Travel Hub. The policies and guidance reviewed within this study include transport plans and strategy produced by Central Government as well as the more regional/local policies adopted by Cambridge, Cambridgeshire and South Cambridgeshire District Council.

### 2.1 National Policy & Guidance regarding Transport

#### 2.1.1 National Planning Policy Framework – 2012 (Department for Communities and Local Government)

The National Planning Policy Framework (NPPF) 2012 outlines the requirement for local authorities to promote sustainable development, including sustainable transport (Section 4). The Rural Travel Hub concept would contribute toward the following objectives:

*“...Transport policies have an important role to play in facilitating sustainable development but also in contributing to wider sustainability and health objectives. Smarter use of technologies can reduce the need to travel. The transport system needs to be balanced in favour of sustainable transport modes, giving people a real choice about how they travel. However, the Government recognises that different policies and measures will be required in different communities and opportunities to maximise sustainable transport solutions will vary from urban to rural areas...”*

*“...Encouragement should be given to solutions which support reductions in greenhouse gas emissions and reduce congestion. In preparing Local Plans, local planning authorities should therefore support a pattern of development which, where reasonable to do so, facilitates the use of sustainable modes of transport...”*

*“...Plans should protect and exploit opportunities for the use of sustainable transport modes for the movement of goods or people. Therefore, developments should be located and designed where practical to...”*

- *“...give priority to pedestrian and cycle movements, and have access to high quality public transport facilities...”*
- *“...create safe and secure layouts which minimise conflicts between traffic and cyclists or pedestrians, avoiding street clutter and where appropriate establishing home zones...”*
- *“...incorporate facilities for charging plug-in and other ultra-low emission vehicles...”*
- *“...consider the needs of people with disabilities by all modes of transport...”*

#### 2.1.2 Transport Investment Strategy (DfT July 2017)

One of the Governments core objectives is to “create a more reliable, less congested and better connected transport network for the users who rely on it” with the Investment Strategy commenting that “our intensively used networks are ageing and face increasing demands, creating delays and undermining reliability. In places they don’t provide the connections people and business need” (Paragraph 3.1).

Paragraphs 3.10, 3.11 and 3.12 of the Strategy, under the heading of “expanding existing capacity to ease congestion”, explain the importance of tackling congestion:

*“...3.10 In many cases we need to invest to upgrade and enhance the existing network, making it better able to cope with demand by adding capacity to reduce congestion and crowding. This not only makes journeys more comfortable and reliable, but can make possible new trips that were previously impractical due to frequent or unpredictable delays.*

*3.11 On the road network, congestion creates delays and bottlenecks on heavily-used routes. And because the network is congested, incidents have a much greater impact, meaning longer recovery times and lower reliability. Managing congestion needs to be environmentally sustainable, and solutions are not limited to adding extra miles of tarmac, but can also include making road layouts more efficient, or investing in the way the network is managed.*

*3.12 Upgrades which tackle congestion typically have high returns. Schemes in our Road Investment Strategy, which included new sections of smart motorway, junction improvements, widening and bypasses show high rates of return, with £1 spent leading to an average return of at least £4.5...”*

Paragraphs 3.14 to 3.18, under the heading of ‘enhancing connectivity by adding new capability’ explain the importance of connectivity within the transport system:

*“...3.14 The connectivity of our transport system – the ease with which places and people are linked together – is a fundamental component of the positive economic contribution it can make. In many cases, we need to invest to add new capability to the network, which transforms travel in a particular corridor or provides opportunities for the travelling public to make journeys in a new way. This may involve creating entirely new routes, investing to better integrate different parts of the network, or delivering step-changes in capacity by bolstering existing routes with stretches of new infrastructure.*

*3.15 These schemes can create new links between communities and workplaces to deepen local labour markets, connect housing developments to the network or provide new routes on city and commuter networks.*

*3.16 They can also include improving access to our ports and airports, integrating the network through hubs, and making possible new and improved journeys between economic centres.*

*3.17 They can range in scale, from small projects which might improve cycle access to a new housing development, through to a new station providing rail access to a whole community, and right up to mega-projects like Crossrail and HS2. These larger connectivity-enhancing schemes can have much more significant wider economic impacts than smaller schemes and help unlock economic benefits on a much larger scale. To unlock growth in productivity, industrial capability and employment, global competitiveness and housing we will need to continue to invest in new or transformed connections.*

*3.18 These three investment priorities – addressing the condition, capacity and connectivity of the network – represent the core ways we can create a more reliable, less congested and better connected network that supports growth and housing...”*

Paragraph 3.21, under the heading of ‘adapting the network to safeguard our environment, safety and health’ states:

*“...3.21 Our investment can also deliver positive outcomes for health and the environment. Providing new cycleways and road networks that accommodate the needs of cyclists and walkers can encourage people to shift from cars to more sustainable and healthy forms of travel, particularly for short local trips that make up the bulk of personal trips...”*

### 2.1.3 Cycling and Walking Investment Strategy (DfT 2017)

It is the Governments ambition to make “cycling and walking the natural choices for shorter journeys, or part of a longer journey”. The document sets out the following objectives:

Government objectives by 2020 (according to Paragraph 1.14) are to:

- *“...increase cycling activity, where cycling activity is measured as the estimated total number of cycle stages made*
- *increase walking activity, where walking activity is measured as the total number of walking stages per person*
- *reduce the rate of cyclists killed or seriously injured on England’s roads, measured as the number of fatalities and serious injuries per billion miles cycled*
- *increase the percentage of children aged 5 to 10 that usually walk to school...”*

Further to this, the Government have set the following aims and target, respectively, to 2025 (Paragraph 1.15):

- *“...aim to double cycling, where cycling activity is measured as the estimated total number of cycle stages made each year, from 0.8 billion stages in 2013 to 1.6 billion stages in 2025, and will work towards developing the evidence base over the next year.*
- *...aim to increase walking activity, where walking activity is measured as the total number of walking stages per person per year, to 300 stages per person per year in 2025, and will work towards developing the evidence base over the next year...”*

- *...increase the percentage of children aged 5 to 10 that usually walk to school from 49% in 2014 to 55% in 2025...*

Paragraph 3.39, under the heading 'Bus Services Bill', states that:

*"...The Bus Services Bill will give authorities the option to take more control of their local services, through implementing Quality Partnerships, new 'Enhanced Partnerships', or through adopting a franchising approach. These approaches will provide authorities with the ability to better integrate bus services with wider public transport networks, and with sustainable travel options such as cycling and walking facilities. Ensuring a seamless transition from public transport to and from walking and cycling routes and networks is key to increasing the number of walking and cycling stages to bus stops and other transport interchanges..."*

## 2.2 Local Policy & Guidance

### 2.2.1 CCC Local Transport Plan (LTP3) – 2014

The third Local Transport Plan (LTP3) is a statutory document which sets out Cambridgeshire County Council's transport objectives, policies and strategy for the county. LTP3 was updated in 2014 to reflect new data and changing context with regard to funding and development plans, to cover the period to 2031. The objectives and policy direction remain unchanged since first being adopted in 2011.

The overarching strategy as outlined in Section 4 states that Cambridgeshire County Council will:

*"widen choice by encouraging more sustainable and environmentally friendly forms of transport including walking, cycling and public transport and will make it easier for people to interchange between different modes of transport".*

The LTP3 sets out objectives relating to journey time reliability, reduction of private car journeys, making sustainable transport more attractive, improving accessibility and minimising environmental impact.

### 2.2.2 Transport Strategy for Cambridge & South Cambridgeshire

The Transport Strategy for Cambridge and South Cambridgeshire (TSCSC) was adopted by Cambridgeshire County Council on 4 March 2014 and ensures that local councils plan together for sustainable growth and continued economic prosperity in the area.

Eight objectives have been set for this strategy, as detailed below:

- *"To ensure that the transport network supports the economy and acts as a catalyst for sustainable growth*
- *To enhance accessibility to, from and within Cambridge and South Cambridgeshire (and beyond the strategy area)*
- *To ensure good transport links between new and existing communities, and the jobs and services people wish to access*
- *To prioritise sustainable alternatives to the private car in the strategy area, and reduce the impacts of congestion on sustainable modes of transport.*
- *To meet air quality objectives and carbon reduction targets, and preserve the natural environment.*
- *To ensure that changes to the transport network respect and conserve the distinctive character of the area and people's quality of life.*
- *To ensure the strategy encourages healthy and active travel, supporting improved well-being.*
- *To manage the transport network effectively and efficiently".*

### 2.2.3 Transport Investment Plan 2016

The Transport Investment Plan (TIP) sets out the transport infrastructure, services and initiatives that are required to support the growth of Cambridgeshire. The schemes included in the TIP are those that the County

Council has identified for potential delivery to support growth. These range from strategic schemes identified through the County Council's transport strategies, to those required to facilitate the delivery of Local Plan development sites for which Section 106 contributions will be sought, through to detailed local interventions. The TIP is used to identify and prioritise projects to be added to the Transport Delivery Plan (TDP). The TDP is the County Council's implementation plan for the delivery of transport and highway schemes to address existing transport problems while at the same time catering for the transport needs of new communities and enhancing the environment.

#### 2.2.4 Greater Cambridge Partnership

The Greater Cambridge Partnership has an overarching objective to make *"it easier to travel in, out and around Cambridge and South Cambridgeshire by public transport, cycle or on foot, and reduce and maintain lower traffic levels to ease congestion"*.

### 2.3 Local & National Transport Policy Summary

In summary the Rural Travel Hub concept could potentially contribute towards achieving the following local and national transport policy objectives:

- Enhancing connectivity/accessibility to, from and within Cambridge and South Cambridgeshire.
- Providing viable sustainable travel options for those living in rural areas.
- Easing congestion in Cambridge by encouraging more sustainable travel into the city.
- Reducing air pollution and carbon emissions by promoting more sustainable travel.
- Encouraging healthy and active travel, supporting improved wellbeing
- To generate economic opportunities – better connections between rural communities and Cambridge will increase the employment and educational opportunities available.

### 2.4 Policy & Guidance regarding Planning

This section provides an overview of the various national and local planning policies pertinent to the suitability of the proposed locations and layout and design of the Rural Travel Hubs. The policies and guidance reviewed within this study include national, regional and local policies adopted by Cambridgeshire County Council, Cambridge City Council, and South Cambridgeshire District Council.

#### 2.4.1 National Planning Policy Framework – 2012 (Department for Communities and Local Government)

The NPPF 2012 outlines the requirement for local authorities to promote sustainable development, The Rural Travel Hub concept should contribute towards the following planning objectives:

*"At the heart of the National Planning Policy Framework is a presumption in favour of sustainable development, which should be seen as a golden thread running through both plan-making and decision-taking.*

*For decision-taking this means:*

- *Approving development proposals that accord with the development plan without delay; and*
- *Where the development plan is absent, silent or relevant policies are out-of-date, granting permission unless:*
  - *any adverse impacts of doing so would significantly and demonstrably outweigh the benefits, when assessed against the policies in this Framework taken as a whole; or*
  - *specific policies in this Framework indicate development should be restricted.*

The NPPF also identifies the fundamental aim of the Green Belt policy is to prevent urban sprawl by keeping land permanently open; the essential characteristics of Green Belts are their openness and their permanence. As such, the Green Belt serves five purposes:

- To check the unrestricted sprawl of large built-up areas;
- To prevent neighbouring towns merging into one another;
- To assist in safeguarding the countryside from encroachment;
- To preserve the setting and special character of historic towns; and
- To assist in urban regeneration, by encouraging the recycling of derelict and other urban land.

When considering any planning application, local planning authorities should ensure that substantial weight is given to any harm to the Green Belt. 'Very special circumstances' will not exist unless the potential harm to the Green Belt by reason of inappropriateness, and any other harm, is clearly outweighed by other considerations.

Certain other forms of development are also not inappropriate in Green Belt provided they preserve the openness of the Green Belt and do not conflict with the purposes of including land in Green Belt. These include

- Local transport infrastructure which can demonstrate a requirement for a Green Belt location. South Cambridgeshire Development Plan

When considering the location and design of the Rural Travel Hubs a further planning assessment will need to be undertaken to determine whether the proposed sites would be acceptable in accordance with Local Development Framework or Local Plan policies. This would involve assessing the Rural Travel Hubs impact on the wider area, such as those impacting the Countryside, Green Belt, Heritage Assets, Conservation or Biodiversity and so on.

## 3.0 Consultation & Engagement

Local input was sought in order to establish views on rural travel and the identification of facilities that will enhance the experience for those living in rural areas.

In the summer of 2016, all Parish Councils in South Cambridgeshire were contacted for initial feedback on the Rural Travel Hub concept. Of the 96 parishes contacted, six were initially identified as potentially feasible and therefore required further investigation. These sites were Shepreth, Meldreth, Whittlesford, Oakington, Foxton and Swavesey. In addition to these sites, and following a district wide review, four further locations have been identified for consideration. These locations are Cambourne, Linton, Sawston and Comberton. Initial liaison has been undertaken with Parish Councils who expressed an interest, as outlined in 3.1.

Separately local stakeholders, specialist interest groups and all Parish Councils were invited to a wider engagement event to discuss concept and record community views. The results of the event are outlined in Section 3.2.

### 3.1 Initial Parish Liaison

Many of the Parishes identified for consideration as hub sites have been consulted directly.

#### 3.1.1 Oakington

The Parish Council are supportive of a small scheme that would enable the Citi6 to turn around at the guided busway, enabling more people from the village to access those routes. They felt there needed to be a solution to the current on street parking and this may include parking restrictions. They would like to see provision of a small drop off/pick up area and improved access for pedestrians and cyclists to the bus hub, as the current narrow kerbside footpath is very dangerous. With new homes planned for Cottenham the guided bus stop in Oakington will be very popular with commuters. The Parish Council were keen to stress that any proposal should not increase the traffic through their village

#### 3.1.2 Linton

Linton Parish Council was not one of the initial six sites suggested through the parish consultation in 2016. Linton is not a hub site that has been prioritised for investigation as a potential pilot, given the ongoing work to improve the A1307 and the projects looking at this. However, if priorities change the Parish Council will be consulted and their views recorded

#### 3.1.3 Shepreth

The Parish Council proposed three sites as potential hubs as part of the initial consultation on this project. On speaking with them, they are keen that any proposals for these sites would have to demonstrate that traffic would not be increased through the village. Local landowners wanted to see more details of any proposals before they could comment. The Parish Council also wanted assurances regarding the management and maintenance of any proposed hub.

#### 3.1.4 Swavesey

The Parish Council agree that the car park alongside the guided bus had served local residents well and had developed into an informal hub. They liked that it was not a widely advertised busway car park and therefore was able to primarily serve local residents. There are few issues with on street parking in the vicinity of the hub. They would like to see the surface replaced with a more hard wearing permeable material. They commented that if the local bus service which links with the guided bus was able to run more frequently and reach all parts of the village, it would help more residents to access better services. They stressed that better cycle storage facilities were required to prevent bike thefts and were keen to explore the potential for the parish to manage their use for local residents. Any proposals to increase the hub at Swavesey would have to address the Parish Council's concerns about increased traffic through the village, which at peak times is a very real issue especially given the amount of on street parking through the village.

# SKANSKA

---

## 3.1.5 Foxton

The Parish Council are keen to resolve the parking issues on Station Road, which regularly cause problems with residents living there and traffic passing through the village. They would not support a large scheme as they do not believe it would be appropriate for Foxton. Any proposal would have to avoid the long term plans of Network Rail, which indicate moving the current crossing resulting in the A10 being routed over or under the railway line.

## 3.1.6 Meldreth

The Parish Council are keen to make improvements to the station access and reduce the amount of on-street parking which regularly impacts on residents. The roads and pavements are very narrow and there are limited options to improve this. There is a path from Melbourn to Meldreth that is regularly used to access the station, but there is no lift to enable wheelchair or pushchair access to the Cambridge bound platform. Improved cycling opportunities from the surrounding villages would help, but this would require investment. A planning application is being considered for land adjacent the station to build 27 properties and resident parking.

## 3.1.7 Whittlesford

The Parish Council are very supportive of any plan to improve the station area and reduce on-street parking in the village and are keen to be considered a pilot for this project. They have set up a neighbourhood plan group to look at the redevelopment of the station. The station draws a lot of people from a large geographical area and the passenger numbers cannot be compared to that of the smaller stations on the Kings Cross line. Access to the station is an issue, with nowhere for buses to turn around and increased pressure on the 500 space car park. There is currently no access to the Cambridge bound platform for wheelchair or pushchairs as no lift is in place. One resident suggested that if there were better cycleways into Cambridge from Whittlesford (particularly from Whittlesford to Great Shelford) then more people may take to their cycles. It was clear from the discussion that a plan for the whole station area needs to be produced which incorporates the hub concept and addresses a number of the other issues.

## 3.1.8 Sawston

The Parish Council are supportive of the idea to improve transport links, reduce congestion and link villages to train, bus or cycle ways but asked that the project team look more widely at all the proposals locally to improve transport, including the A1307 proposals, options for Spicers station, greenways and Cambridge South before drawing any conclusions. In particular they would like to see improvements to the cycleway/footpath from Sawston to Whittlesford station, along with an agreed maintenance and management plan for any new paths to ensure they are fit for purpose over the long term. They were also keen to stress the importance of addressing access issues for the elderly, disabled and families

## 3.1.9 Comberton

Comberton Parish Council was not one of the initial six sites suggested through the parish consultation in 2016. Comberton is not a hub site that has been prioritised for investigation as a potential pilot. However, if this changes the Parish Council will be consulted and their views recorded.

## 3.1.10 Cambourne

The Parish Council are very keen for a travel hub having been on the list before for such a proposal. They would prefer a hub to be in the vicinity of the High Street, given its location in the centre, near car parking and the routes of current buses. Cycle storage at the Parish Council office could also be extended and car parking already exists at the PC office and at Morrison's/other shops.

There are good cycle links within. There are a number of bus routes coming through the village and scope to make a fast link through to Cambridge, linking with other GCP projects such as the Cambourne to Cambridge Better Buses. A few DRT (Demand Responsive rTransport) schemes also operate into Morrison's and could be extended to take in other villages and link to a bus hub in Cambourne.

## 3.2 Stakeholder Event

A stakeholder engagement event was held on the evening of Wednesday 6<sup>th</sup> September 2017 at the South Cambridgeshire District Council office in Cambourne, with 47 attendees present. The evening's agenda comprised the following:

- Welcome, Concept and Background – Cllr Burkitt
- Procurement and Governance – The Project Team
- Feasibility Study – Skanska
  - a) Introduction to the Feasibility Study
  - b) Key objectives of the Rural Travel Hubs concept
  - c) Study methodology
  - d) Travel patterns in South Cambridgeshire
  - e) The Swavesey Model
  - f) Site criteria (size, spaces, access, location, availability of land etc.)
  - g) Potential facilities at Rural Travel Hub locations.
  - h) Purpose of the workshop – Why we need your help.
- Engagement and Next Steps – The Project Team
- Workshop – Interactive group discussions on the issues affecting rural travel and an evaluation of the Rural Travel Hub concept.
- Scoring Exercise – To establish the level of support for the Rural Travel Hub concept.

### 3.2.1 Workshop Summary

Attendees were invited to participate in a group discussion, considering the following questions:

- a) What are the factors that influence public transport usage in rural areas?
- b) What are the factors that influence cycle usage in rural areas?
- c) What services and facilities would you like to be provided at Rural Travel Hubs?
- d) Identify the strengths and weaknesses of the Rural Travel Hub concept.

A record of the discussions can be found in Appendix C. The feedback received has been considered when developing the definition and determining the requirements of Rural Travel Hubs.

### 3.2.2 Scoring Exercise

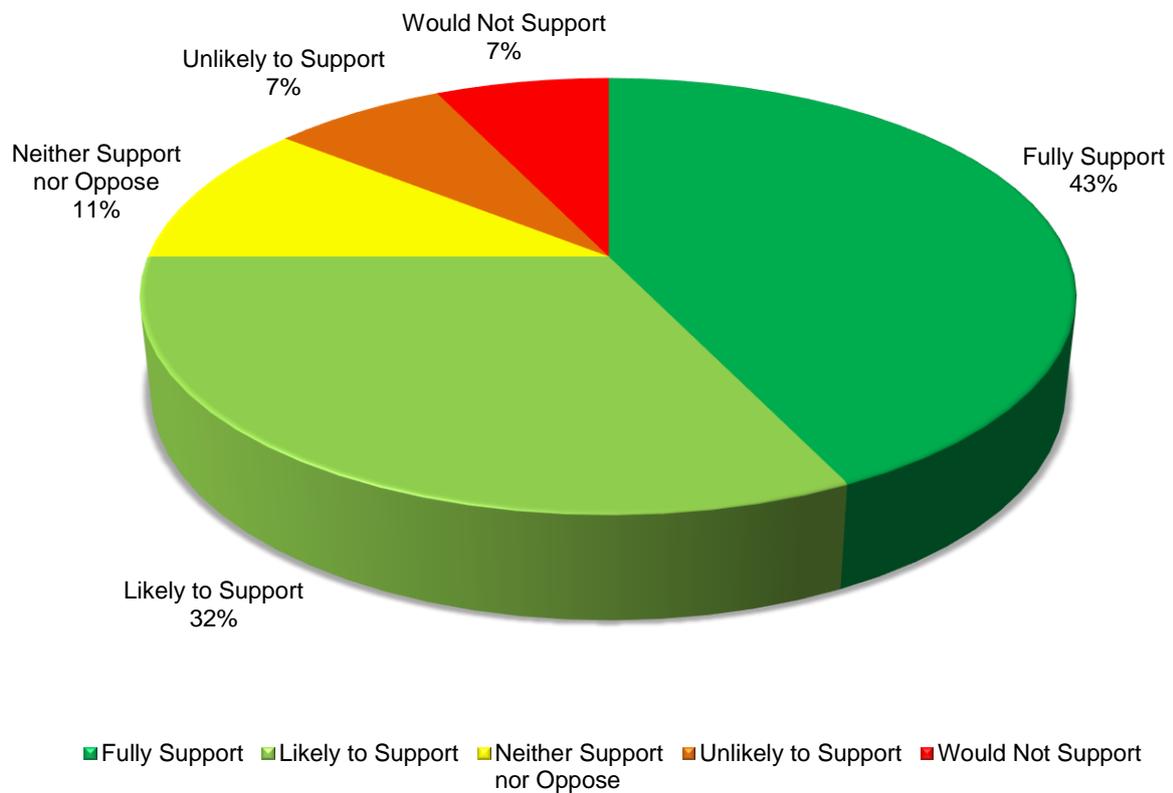

A scorecard was developed for the event as a means of gauging the level of support for the Rural Travel Hub concept. All attendees were asked to complete the scorecard at the end of the evening. A copy of a blank scorecard can be found in Appendix D1.

The scorecard asked two questions (as detailed below) and asked attendees to provide a score of between 1 and 5, with 1 being 'would not support' and 5 being 'fully support'. A comments box was also provided to allow attendees to include a justification for their answer.

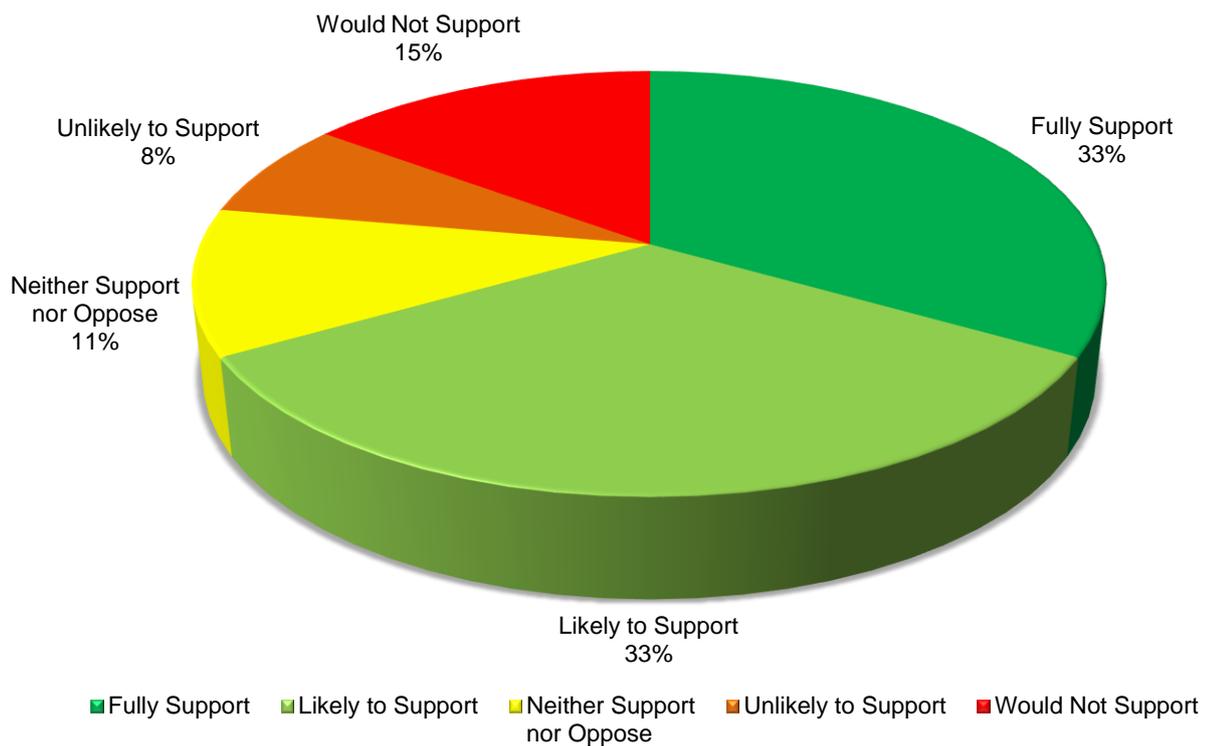

- a) Do you support the Rural Travel Hub concept?
- b) Would you support a Rural Travel Hub in your Parish?

Not all of the attendees completed a scorecard. 28 scorecards were collected at the end of the evening.

The results of the scorecard exercise are shown on Charts A & B.

**Chart B: Would you support a Rural Travel Hub in your Parish?**

The results indicate a high level of support with 75% of respondents supportive of the Rural Travel Hub concept compared to 14% who were not supportive.

Similarly 66% would support a Rural Travel Hub in their own parish compared to 23% who not supportive.

A summary of the scorecard results and associated comments can be found in Appendix D2.

### 3.3 South Cambridgeshire District Council Planning Liaison

South Cambridgeshire District Council Planning Department undertook a high-level review and commentary of the potential hub locations, highlighting potential planning constraints and requirements. A summary of their informal feedback has been included for each site within the detailed site reviews in Section 9. Further consultations would have to be undertaken due to constraints on various sites, should they be taken forward. The planning constraints have also been used to inform the scores relating land availability and access in the site Prioritisation Matrix detailed in Section 11.

## 4.0 Rural Travel Hub Definition

### 4.1 What is a Rural Travel Hub?

Through the consultation and engagement process the following definition of a 'Rural Travel Hub' has been developed. The term 'Rural Travel Hub' is defined as a **'transport facility that serves as an interchange, close to existing transport corridors (that are served by a reliable and relatively frequent public transport service), where residents in rural areas can walk, cycle or drive to and continue their onward journey using a sustainable mode of travel'**.

### 4.2 How do Rural Travel Hubs Operate?

The Rural Travel Hub is essentially a form of integrated transport enabling users to walk, cycle or park their vehicles at a designated facility and access Cambridge via a sustainable mode of transport, thus relieving congestion on the arterial routes into and within the city centre.

Whilst a key objective of the Rural Transport Hub concept is to reduce the number of private car journeys into Cambridge, it was clear during the consultation and engagement process that there is a strong desire for more general public transport service improvements in rural areas, for example better interconnectivity between neighbouring towns and villages. The hub facilities will enable users to travel to locations other than Cambridge where located on transport routes. They would also be able to be used as stops for Demand Responsive Transport services and Community Transport.

The Rural Travel Hub differs subtly from other forms of integrated transport facilities such as Park & Ride. Traditionally, a Park & Ride facility predominantly targets private motorised users, encouraging them to park their vehicles at the designated facility before continuing their onward travel by means of the public transport network. Such sites are usually situated on the outskirts of cities; the objective being to minimise the volume of private vehicles in inner city areas.

Rural Travel Hubs could be seen as a form of hybrid facility. Whilst generally small scale car parking facilities will be provided at each hub location for motorists, there will be a bias towards encouraging active travel to and from the sites by making them attractive to cyclists and pedestrian users once at the hub.

Each hub will be bespoke. It is not a case of 'one size fits all', but rather that the Rural Travel Hub will be designed to suit the community it serves taking into consideration its location, the available transport links and planning constraints. This report highlights conceptual site layouts in Appendix B. In further stages of this project more detailed design options for each site will be provided to suit the requirements of the specific location.

## 5.0 Case Study

Whilst there are no existing designated Rural Travel Hubs in the South Cambridgeshire District, an existing transport facility at Swavesey has been reviewed as part of the Feasibility Study. The Swavesey Guided Busway Stop has evolved into something akin to a Rural Travel Hub, and perhaps best represents what a hub may look like.

### 5.1 Swavesey Guided Busway Stop

The Cambridgeshire Guided Busway was officially opened in August 2011 and connects Cambridge, Huntingdon and St. Ives, with much of the route following a disused railway line. The Busway comprises guided tracks in both directions, with an adjacent shared use footway/cycleway, affording access for pedestrians and cyclists.

Originally the Swavesey Busway Stop consisted of bus shelters for passengers and 20 covered cycle stands. Increasing cycle usage led to an additional 35 uncovered cycle stands being provided. A compound, approximately 70m from the busway, used during construction was converted to a designated drop-off area and small car park, with space for up to 15 vehicles (including 1 disabled bay). Subsequently, again following increasing demand, the car park was extended to its current size and able to accommodate approximately 40 vehicles (see images below).

Image 5.1: Swavesey Busway car park.

Image 5.2: Swavesey Busway cycle storage.

#### 5.1.1 Facilities

The facilities at the hub include:

- A car park for a maximum of 40 vehicles, with one designated disabled bay. The car park is located on Station Road approximately 70m to the north of the Busway. There is a separate 'IN' and 'OUT' vehicular access arrangement with 2.1m height barriers to restrict usage to cars only. The car park also features a designated drop-off area, which is signed from Station Road. A footway provides pedestrian access between the car park and Busway. Station Road is street-lit, which therefore illuminates the vehicular accesses and footway link to the busway stop. The car park is not street lit. The car park surface is unbound gravel, with the exception of the disabled bay and drop-off area which have a bound bituminous surface (see image 5.1).
- Cycle parking alongside the St. Ives bound track of the Busway. There are 55 'Sheffield' cycle stands in total, 20 covered and 35 uncovered. (see image 5.2)
- A pair of bus stops on Station Road, located approximately 90m to the north of the Busway. These provide a link to the Busway for local bus services, including the Citi 5 service which generally runs at 2-hourly intervals.
- CCTV at the Busway stop and cycle park, but not at the separate car park.
- Real Time Information signs at the Busway stops.

- Shelters at the Busway stops, including passenger information signs.
- Emergency help button at the Busway stops.
- Ticket machines at the Busway stops.
- Shared use footway/cycleway along the western side of Station Road/Over Road that provides a pedestrian/cycle link between the village of Over to the north (a distance of approximately 1.3 miles) and Swavesey to the south (a distance of approximately 3/4 mile).
- Bicycle tyre pump.

### 5.1.2 Survey

Two surveys were undertaken at the Swavesey Busway stop, one during the school summer holidays in August and the other during school term-time throughout September. These were undertaken to establish usage patterns, gauge the opinion of users on the quality of the transport infrastructure provided and additional facilities desired. Undertaking two surveys allowed comparisons to be made between usage during term-time and school holidays. The August survey also enabled indicative usage patterns to be established prior to the Consultation Event of 6th September. The results of the surveys are summarised below:

#### Survey 1 – School Summer Holiday (August)

Date of Survey: Thursday 10th August 2017  
Time of Survey: 06:00 – 13:00  
Sample set: 87  
Car park traffic count: every 15 mins (06:00 – 13:00)

#### Notable findings:

- 87 people surveyed (representing majority of those using the inbound service – users travelling outbound (to St Ives) were not included in the survey). Not all inbound users were captured owing to multiple users arriving simultaneously and the frequency of service.
- Majority of users from villages of Swavesey or Over; others from further afield at Fen Drayton & Fenstanton (although these represented the minority). No users were surveyed from outside these 4 areas.
- Popular destinations; Cambridge 'city centre', Railway Station, Milton Science Park & Addenbrooke's Hospital.
- Vast majority walked, cycled or used car park facility to access Swavesey Busway Stop (only one user travelled to the facility via bus)
- No vehicles present in car park at 05:30am (inference is no overnight parking issue at time of survey)
- Some users were unaware the car park was for the general use for those using the Busway (i.e. under the impression it was a drop-off point?)
- One instance of vandalism to a vehicle parked in the car park was noted among respondents.
- Max number of vehicles in car park at any one point during survey = 32 (ponding water accounted for ~2-3 spaces)
- Reports of cycle theft – users cited concerns over cycle security and noted this as the main reason for not using the cycle storage facility.
- Cycle storage capacity for 110 cycles on 55 Sheffield cycle stands (20 covered, 35 uncovered): 14 bikes present at start of survey, 11 damaged/unusable, max. net gain of +19 bikes during survey (30 spaces occupied).
- Feedback from users generally positive

- Comments on condition of surfacing & lack of drainage in car park
- Issues with automated ticket machines (often unreliable/out of order)
- Monthly pass discount is negligible/unattractive (users purchasing 'long-term' passes felt they should get more of a discount and this would act as an incentive).
- The 'free parking' was deemed a positive by those using the car park – making Swavesey an attractive option. Several respondents asked if there was a plan to start charging.

## Survey 2 – School Term-time (September)

*Date of Survey:* Wednesday 27th September 2017  
*Time of Survey:* 06:00 – 13:00  
*Sample set:* 102  
*Car park traffic count:* every 15 mins (06:00 – 13:00)

### Notable findings:

- 102 people surveyed (representing majority of those using the inbound service – users travelling outbound (to St Ives) were not included in the survey, but were counted). Not all inbound users captured owing to multiple users arriving simultaneously and the frequency of service.
- Majority of users are from the villages of Swavesey or Over; others were from further afield (although these represented the minority).
- Popular destinations were; Cambridge 'city centre', Railway Station, Milton Science Park & Addenbrooke's Hospital.
- One vehicle was present in the car park at 06:00am (inference is that there is no 'general' overnight parking issue at time of survey).
- Some users were unaware the car park was for the general use of those using the Busway (i.e. under the impression it was a drop-off point only).
- The maximum number of vehicles in the car park at any one point during survey was 42 (2 vehicles parked on grass verge within extents of car parking area). The maximum capacity of designated parking area is assessed to be 40.
- Reports of cycle theft – users cited concerns over cycle security and noted this as the main reason for not using the cycle storage facility.
- Cycle storage capacity for 110 cycles on 55 Sheffield cycle stands (20 covered, 35 uncovered): 16 bikes present at start of survey (9 within covered section, 7 uncovered). The maximum number of cycles recorded during survey was 65.
- Feedback from users on the transport facilities provided was generally positive.
- Comments were made on the poor condition of car park surface & lack of drainage leading to ponding in the car park.
- Users commented on disparity of the Busway fares (those traveling 1 stop had to pay full fares rather than "pro-rata" approach used in other transport system such as the London Tube zonal system).
- Issues experienced with the automated ticket machines (often unreliable/out of order).

5.1.2.1 Usage

A summary of the key findings from the surveys is presented below:

**How often do you use the Swavesey Transport Facilities?**

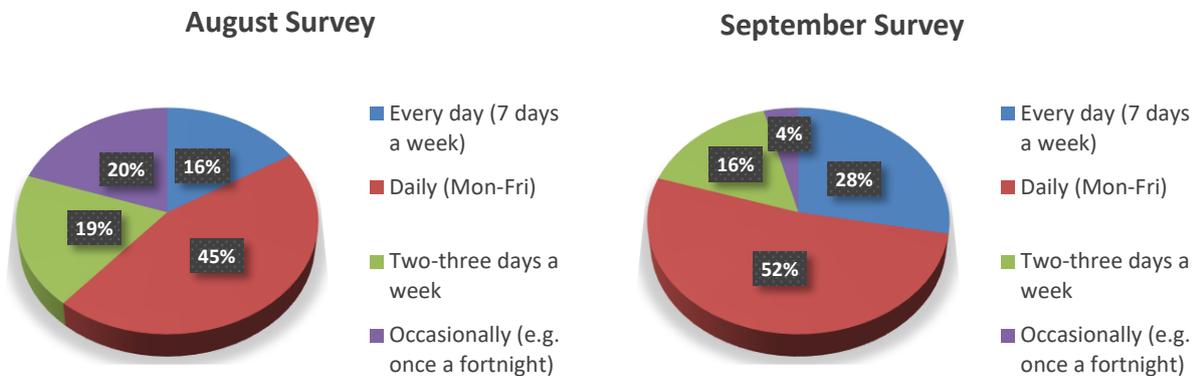

Chart 5.1 – Frequency of use (Bus Stop)

Chart 5.1 indicates that the majority of users travel on a daily basis during the week. The number of ‘occasional’ users is increased during the school holiday period (August), whereas there is an increased number of daily users (both 7-days and Monday-Friday) during the term-time (September) survey. This is likely to be due to the increased number of students and commuters.

**Do you use the Swavesey car park to access the Guided Busway stop?**

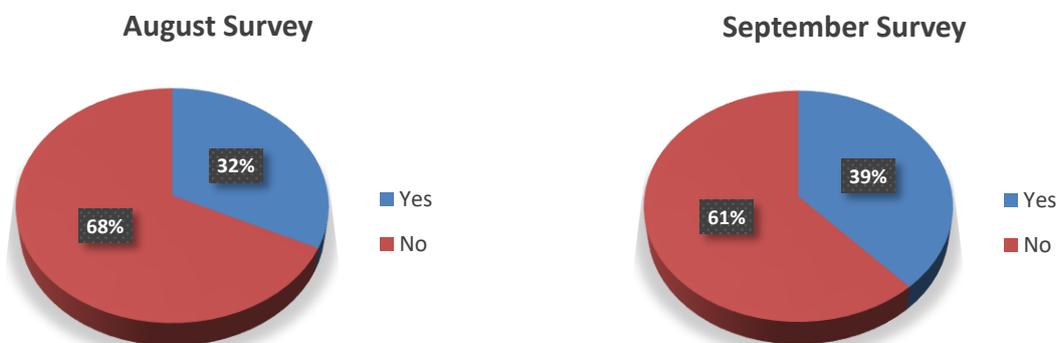

Chart 5.2 – Car park usage

Chart 5.2 shows that marginally over one-third of those surveyed use the nearby parking facility to either park their vehicle or be dropped off at the designated set-down area (broadly similar results observed for both August and September surveys). During the September survey it was observed the vast majority of car park users (91%) were travelling on the inbound service to Cambridge.

One vehicle was present in the car park at the start of the September survey (06.00am) indicating that, on the day of the survey, overnight parking did not appear to be an issue. The car parked overnight left the car park at 08.30am and was driven by a user who alighted from the outbound service (to St Ives). No vehicles were observed in the car park at the start of the August survey.

During the September survey, the car park reached its capacity at 09.45am, a further 2 vehicles mounted the kerb within the extents of the car park and parked on the grass verge, making the total number of vehicles

within the car park 42 (including 1no. occupied disabled space). Beyond this multiple cars accessed the car park, but left due to a lack of suitable spaces. One user parked their car on the south-east verge opposite St Andrews Church, before making their way to the Busway stop. Another user was observed parking on the west side of and to the north of the busway. A number of users were dropped off in the bell-mouth of the MG Owners Club access road, rather than at the designated drop-off facility. During the August survey, the car park never reached full capacity within the survey period.

**What is the purpose of your journey?**

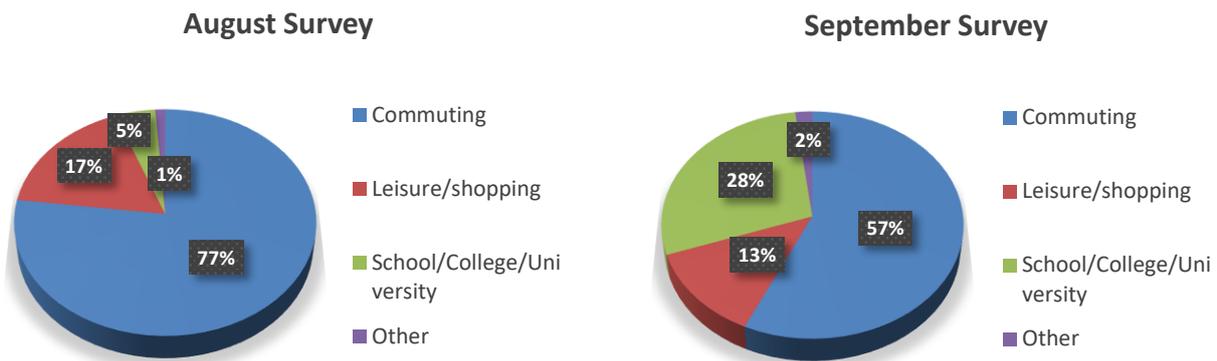

Chart 5.3 – Purpose of journey

Chart 5.3 shows that over half of those surveyed use the Swavesey Busway Stop for commuting to work (57%) during the September survey (compared with 77% recorded during August), with the majority of commuters arriving before 08.30am. A further 28% of users were travelling to educational establishments during term time (compared with 5% during the holiday period). Those accessing the facility for leisure remained broadly constant over the two surveys and tended to arrive later in the morning and many used concessionary passes that were valid after 09.30am.

**What is your usual mode of transport to the Swavesey transport facilities?**

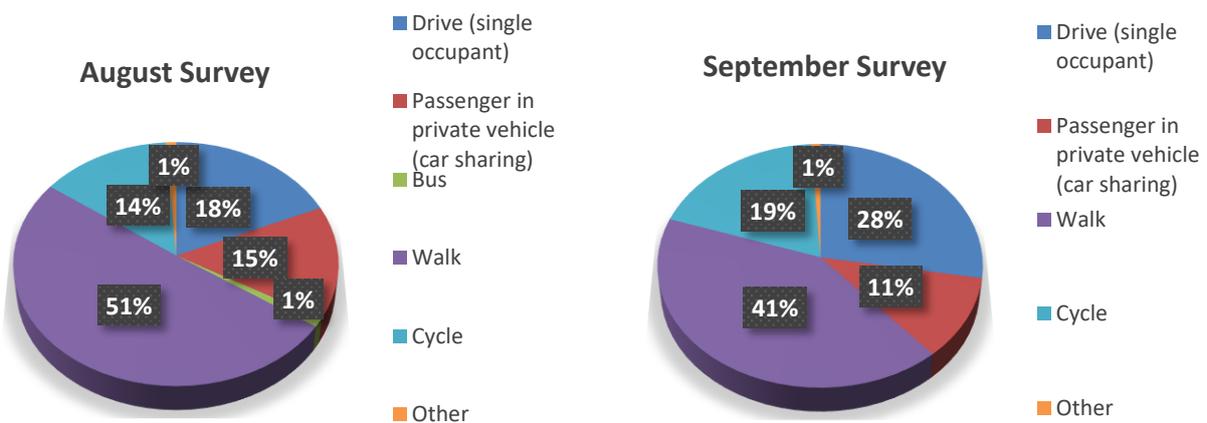

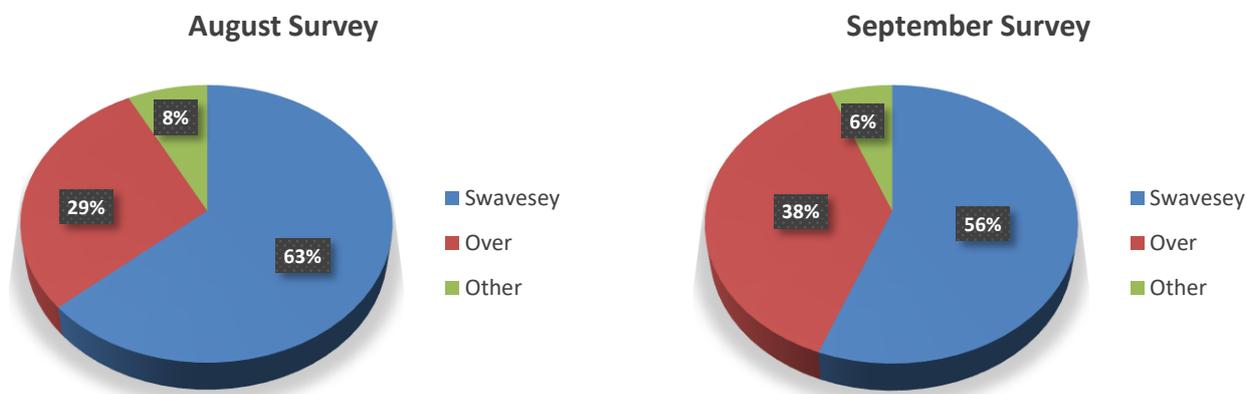

Chart 5.4 – Mode of transport to the hub

Chart 5.4 indicates the most popular method of travel to the hub is on foot during both surveys (51% of users walking in August compared with 41% during September). During term-time (September survey) just over one

quarter (28%) used the car parking facility, with 11% of users being dropped-off (accounting for the 39% car park / drop-off point usage noted in Chart 5.2). There was a slight increase in the number users accessing the site by cycle in September, 19%, compared to 14% during in August. In September more single occupant vehicles were recorded using the car park, 28% compared to 18% in August.

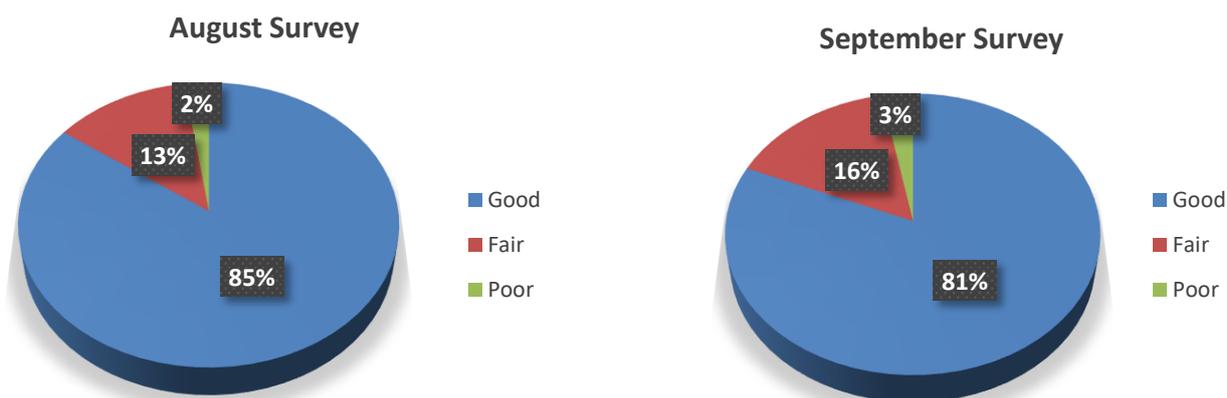

**Where was the start of your journey?**

*Chart 5.5 – Journey origin*

Chart 5.5 shows the vast majority of users were local residents of Swavesey and Over (92% August, 94% September). The number of users walking and cycling to the facility (shown in Chart 5.4) also suggests a predominantly local use. The combined population of Swavesey & Over is 5,325 (2011 census) which gives an indication of the population that a similar sized hub could potentially serve.

**Overall how would you rate the Swavesey transport facilities?**

*Chart 5.6 – User opinion*

Chart 5.6 shows the vast majority of respondents rate the facility as being 'Good' (on a 'Good, Fair, Poor' scale) demonstrating a generally positive view of the facility among those who use it, with results being consistent in both surveys.

## 6.0 Benefits & Dis-benefits of Rural Travel Hubs

As with any proposed infrastructure development, the notion of designated Travel Hubs to enhance connectivity between rural outer-lying parishes and Cambridge has a number of benefits. However, conversely there are also a number of potential dis-benefits that should be considered. These are discussed within the subsequent sections:

### 6.1 Benefits

The benefits associated with the installation of a Rural Travel Hub facility are presented below:

#### 6.1.1 Congestion Reduction

One of the main objectives and indeed benefits of a Rural Travel Hub is the reduction of private vehicular traffic in and around Cambridge. The provision of a Rural Travel Hub Facility will enable commuters to travel into Cambridge using public transport and/or cycleways, thereby reducing the total number of private vehicles and easing congestion in and around the city. The success of the two pilot sites will need a measure to determine the hubs' ability to reduce traffic and provide the residents of rural South Cambridgeshire with access to provisions for sustainable travel into Cambridge.

#### 6.1.2 Environmental Benefits

A reduction in the volume of traffic in Cambridge will have a positive impact in terms of air pollution and reducing the overall carbon emissions in these more central areas. Additionally, there would also be an opportunity to promote more sustainable travel if facilities such as charging points for electric vehicles were provided at the Hubs.

#### 6.1.3 Public Health Benefits

In addition to the reduction in private/single occupancy vehicles and congestion, the provision of strategically located Rural Travel Hubs can have a positive benefit on public health. Such hubs could enable people to either walk or cycle to a designated point from which they could use public transport to reach the city centre.

#### 6.1.4 Public Perception

The implementation of Rural Travel Hubs may act to heighten awareness of the public transport systems in and around Cambridge. The connectivity between more rural communities and the mainstream transport corridors can offer a degree of inclusion for areas previously isolated from the public transport network.

#### 6.1.5 Economic

By connecting the rural communities of South Cambridgeshire to Cambridge, the employment and educational opportunities available to those living in rural areas will be improved.

The hub offers an opportunity for car users to park their vehicles and then access the city centre using existing bus or train services and/or cycleways as well as other sustainable travel modes. In addition to reducing congestion, by leaving vehicles at the Rural Travel Hub, there can be a financial benefit to motorists when considering additional fuel and parking charges within Cambridge (as it is intended that car parking at the hub sites will be free). This would be a factor in making the Rural Travel Hub a more attractive and appealing option to some commuters.

#### 6.1.6 Outreach Activities

Rural Travel Hubs may provide inclusion to areas which may otherwise appear isolated. Hubs could be a focal point not only for a community's transportation needs, but also be pivotal in terms of outreach activities. For example, the facility may offer suitable location and amenities for cycle proficiency training, neighbourhood policing, mobile library, mobile health screening, blood donation, recycling point, Community Playbus and act as a convenient meeting point for cyclists and ramblers.

### 6.1.7 Transport Connections

Rural Travel Hubs could provide a vital link in the improved connectivity of communities of South Cambridgeshire with the wider County infrastructure network. Examples could include Demand Responsive Travel, Community Transport and the potential development of shuttle buses to and from the Hubs. The addition of such services in rural settings can open the door for wider accessibility to the district's other transport links which make the county and city of Cambridge a more inclusive area to live and work.

## 6.2 Dis-benefits

The potential dis-benefits associated with the installation of a Rural Travel Hub facility are presented below:

### 6.2.1 Environmental Intrusion

The location of the Rural Travel Hub is a critical consideration. They should ideally be located in an accessible area to the rural parishes they serve in order to provide connectivity to the city and other transport links within the county. However, many areas in South Cambridgeshire are likely to be considered 'Green Belt' or the open countryside and therefore potential development may be met with local opposition from the communities it is intended to serve. Consideration therefore should focus on 'Brownfield' (previously developed) sites in the first instance. The location of the Rural Travel Hub must both fit the needs of the local community but not be visually intrusive. They will also need to address planning policy requirements including Green Belt.

### 6.2.2 Local Traffic Congestion

A key objective of the Rural Travel Hub concept is to ease congestion in Cambridge by encouraging the use of more sustainable travel. The installation of such a hub may potentially result in a localised increase in traffic movements at the proposed sites. Whilst the level of localised congestion in the vicinity of the Hubs is anticipated to be relatively low due to their modest size, there is potential that the travelling public from outside the immediate locality may converge on the new sites. However, as established in the Swavesey case study, it is envisaged that the facilities will be mainly used by local residents, who would otherwise be travelling by private vehicle to their destination, such that any net gain in traffic volumes is likely to be minimal.

### 6.2.3 Maintenance

There will be a requirement to maintain the Rural Travel Hub throughout its design life. The cost associated with this ongoing maintenance regime will depend largely on the size of the hub and what facilities and amenities are provided. The design of the Rural Travel Hubs will be done in a way as to minimise the maintenance of the sites as much as possible. There is likely to be some level of maintenance required however, and this will be detailed in further stages of the project.

### 6.2.4 Effectiveness

The effectiveness of Rural Travel Hubs in reducing vehicle congestion in Cambridge is dependent on the number of people using them. Due to their relatively small size, it could be argued that their impact could be negligible in achieving this objective.

Where the hub sites are located close to existing chargeable parking facilities (e.g. Whittlesford Railway Station) there is the potential for the hub car parks to quickly reach capacity, with car users electing to use the free facility.

It cannot be assumed all hub users will be heading into Cambridge. It is likely the hub sites will also be used by commuters heading to other destinations. This will inhibit the effectiveness of the sites in terms of reducing the number of car journeys into Cambridge.

### 6.2.5 Improper / Anti-social Use

Whilst a Rural Travel Hub could represent a suitable focal point for community activities (e.g. suitable meeting place for cyclists and ramblers as identified in Section 6.1.6), it could also attract less desirable anti-social behaviour or improper use. This may be a source of opposition to the implementation of such hubs.

## 6.2.6 Capacity of the existing Public Transport Network

Potential users may not use hubs that are located alongside busy public transport corridors that operate at capacity at peak times because they might not be able to find a seat or even board the service. Additional services to enhance capacity may be required at certain locations to encourage use of the hubs.

## 6.3 Overall Benefit to Dis-benefits (outline BCR)

When looked at as a whole, the potential expected benefits of providing Travel Hubs in Rural South Cambridgeshire outweigh the dis-benefits as it is considered that the dis-benefits can be suitably mitigated against.

## 7.0 Baseline Transport & Socio-economic Impact Review

This section summarises general demographics, transport behaviours and socio-economic characteristics for the South Cambridgeshire District, based on the data captured during the 2011 Census for England & Wales. Data is also presented for the wider Cambridgeshire area, the East of England region and the overall statistics for England & Wales as a whole, enabling direct comparison between district, county, geographic region & national level.

### 7.1 Demographics and Socio-Economic Characteristics

#### 7.1.1 General Demographics

South Cambridgeshire District has a total population of 148,755 according to the 2011 England and Wales Census. In the context of Cambridgeshire as a whole this represents just under one quarter (23.9%) of the total population (621,210). South Cambridgeshire District comprises of 34 electoral wards. It completely surrounds the city of Cambridge, which is administered separately from the district by Cambridge City Council.

The table below, Table 7.1.1, shows typical demographic indicators for each designation.

Census Output Area	Population (2011)	Households	Average persons per household	Median Age	Mean Age
South Cambridgeshire District	148,755	59,960	2.4	41.0	40.1
Cambridgeshire	621,210	251,241	2.4	39.0	39.5
East of England	5,846,965	2,423,035	2.4	40.0	40.2
England & Wales	56,075,912	23,366,044	2.4	39.4	39.7

*Table 7.1.1 – General demographic indicators*

*Source: 2011 Census Data (England & Wales) – Tables KS101EW, KS105EW, KS403EW & KS102EW*

From Table 7.1.1 it can be seen that the South Cambridgeshire District exhibits the same average number of persons per household as Cambridgeshire, East of England and indeed England & Wales as a whole. The median age of South Cambridgeshire residents is higher than that for Cambridgeshire, East of England and England & Wales. Similarly, the mean age of those living in South Cambridgeshire is higher than the corresponding mean age for Cambridgeshire and England & Wales as a whole, but is marginally lower than that for the East region.

#### 7.1.2 Employment

The following Table 7.1.2 summarises economic activity within the South Cambridgeshire District and compares this directly with data for the wider county of Cambridge, the East of England and England & Wales as a whole.

Census Output Area	Economically Active - Working (Aged 16-74)	Employed		Self Employed	Unemployed	Full Time Student
		Part Time	Full Time	FT & PT		
South Cambridgeshire District	74,393	12,877	47,627	16%	3.95%	2.56%
Cambridgeshire	315,206	61,668	196,182	14%	5.14%	3.90%
East of England	2,650,835	592,403	1,524,201	16%	7.13%	3.83%
England & Wales	26,414,207	5,634,988	15,733,446	15%	8.09%	4.06%

*Table 7.1.2 – General demographic indicators*

*Source: 2011 Census Data (England & Wales) – Tables WP601EW & DC6107EW*

South Cambridgeshire has a higher rate of employment than both the East of England region (79.85%) and England & Wales average (80.90%) with 81.33% of all economically active residents of South Cambridgeshire in some form of employment. The rate of employment is marginally less than that for Cambridgeshire (81.80%). Unemployment levels are relatively low in South Cambridgeshire at 3.95% which compares favourably to Cambridgeshire (5.14%), East of England (7.13%) and overall England & Wales figures of 8.09%.

## 7.2 Existing Travel Behaviour

### 7.2.1 Method of Travel to Work

The 2011 census data was interrogated to establish peoples' method of travel to work. The table below compares residents' primary mode of transport to their place of work.

Census Output Area	METHOD OF TRAVEL TO WORK / STUDY - TOTAL (%)												
	All categories: Method of travel to work	Work mainly at or from home	Underground, metro, light rail, tram	Train	Bus, minibus or coach	Taxi	Motorcycle, scooter or moped	Driving a car or van	Passenger in a car or van	Bicycle	On foot	Other method	Not in employment (not travelling)
South Cambs District	107,779	5.7%	0.1%	2.7%	3.2%	0.1%	0.7%	46.9%	2.9%	5.8%	4.9%	0.4%	26.6%
Cambridgeshire	461,380	4.5%	0.1%	2.6%	2.4%	0.2%	0.5%	41.4%	3.1%	6.6%	6.6%	0.4%	31.5%
East of England	4,245,544	3.8%	0.8%	4.8%	2.5%	0.3%	0.5%	41.4%	3.4%	2.4%	6.8%	0.4%	32.9%
England & Wales	41,126,540	3.5%	2.5%	3.3%	4.7%	0.3%	0.5%	37.1%	3.3%	1.9%	6.9%	0.4%	35.5%

*Table 7.2.1 – Primary method of travel to work (Age 16-74)*

*Source: 2011 Census Data (England & Wales) – Table QS701EW*

Table 7.2.1 shows that the number of residents travelling to work by car/van in South Cambridgeshire (46.9%) is higher than that for Cambridgeshire as a whole and the East region (both 41.4%) and significantly higher than the total percentage for England & Wales (37.1%). The number of people travelling to work by bicycle in South Cambridgeshire (5.8%), whilst lower than Cambridgeshire as a whole (6.6%), is significantly higher than the corresponding proportions for the East of England (2.4%) and England & Wales (1.9%).

### 7.2.2 Motorised vehicle movements on key radials

The Traffic Monitoring Report is a collation of data taken from various locations throughout Cambridgeshire and is summarised in a single report produced once a year. Appendix J shows data taken from some of the radial cordon sites surrounding Cambridge. These cordon sites are Babraham Road, Shelford Road, Hauxton Road, Barton Rd, Madingley Rd, Huntingdon Road, Girton Road, Histon Road, Busway North and Milton Road. This data is able to provide information on traffic flows for a 12hr period between 7am-7pm.

As Appendix J shows, there is potential for Rural Travel Hubs to remove some of the traffic on these radials. It is important to note that the Rural Travel Hub concept is intended to provide those living in rural communities the ability to access sustainable modes of travel into Cambridge and is not solely focussed on reducing commuter numbers.

### 7.2.3 Car ownership

The following Table 7.2.2 shows the proportion of households with access to a car or van

Census Output Area	Percentage of Households with Access to a Car or Van
South Cambridgeshire District	89.0%
Cambridgeshire	82.6%
East of England	81.5%
England & Wales	74.4%

*Table 7.2.2 – Percentage of households with access to a car or van*

*Source: 2011 Census Data (England & Wales) – Table KS404EW*

The proportion of households with access to a car or van in South Cambridgeshire (89.0%) is significantly higher than that for the Cambridgeshire area as a whole (82.6%), the East of England (81.5%) and the overall figure for England & Wales (74.4%).

### 7.2.4 Distance travelled to place of work

Table 7.2.3 shows the average distances travelled to work for residents of the South Cambridgeshire District, Cambridgeshire, East of England and England & Wales

Census Output Area	DISTANCE TRAVELLED TO WORK - TOTAL (%)										Average distance (km)
	Less than 2km	2km to less than 5km	5km to less than 10km	10km to less than 20km	20km to less than 30km	30km to less than 40km	40km to less than 60km	60km and over	Work mainly at or from home	Other	
South Cambs District	9.5%	11.9%	20.5%	21.7%	5.7%	2.3%	2.7%	5.4%	13.2%	7.1%	17.4
Cambridgeshire	16.3%	14.6%	13.2%	16.6%	8.5%	3.2%	2.6%	5.8%	11.8%	7.4%	18.1
East of England	16.5%	15.4%	12.7%	14.8%	8.4%	4.5%	4.4%	3.7%	10.7%	8.9%	17.3
England & Wales	16.6%	18.3%	17.3%	15.3%	5.8%	2.6%	2.3%	3.1%	10.3%	8.4%	15.3

*Table 7.2.3 – Distance travelled to work*

*Source: 2011 Census Data (England & Wales) – Table QS702EW*

The majority (54.1%) of South Cambridgeshire residents travel between 2km and 20km to their place of work. This is higher than the overall figure for Cambridgeshire (44.4%), the East of England (42.9%) and England & Wales (50.9%). The average distance travelled to work for those in South Cambridgeshire (17.4km) is marginally less than that for Cambridgeshire as a whole (18.1km), broadly similar to East of England average (17.3km), but more than the average for England & Wales (15.3km).

### 7.2.5 Location of Place of Work

Based on the 2011 census data, and using the *DataShine Commute* online tool, it is possible to determine origin-destination information for those commuting to work. In terms of the Rural Travel Hub project the number of persons travelling into Cambridge is of particular interest. As such those who work from home, work within the same Super Output Area (SOA), have no fixed place of work or work outside of the UK have been excluded from the summary. For each hub location a percentage has been derived which indicates the number of people whose work is based outside the hub SOA and travel into Cambridge from the given location. This information is presented in Table 7.2.4 below.

Hub Location	Nearest Super Output Area (SOA)	Percentage Travelling to Cambridge SOA	Selected Other
<b>Oakington</b>	SC 003 Swavesey, Longstanton, Cottenham	47%	Milton SOA (6%)
<b>Linton</b>	SC 016 Linton	41%	Duxford SOA (10%)
<b>Shepreth</b>	SC 018 Fowlmere and Foxton, Melbourn, Meldreth	30%	London SOA (5%)
<b>Swavesey</b>	SC 003 Swavesey, Longstanton, Cottenham	47%	Milton SOA (6%)
<b>Foxton</b>	SC 018 Fowlmere and Foxton, Melbourn, Meldreth	30%	London SOA (5%)
<b>Meldreth</b>	SC 018 Fowlmere and Foxton, Melbourn, Meldreth	30%	London SOA (5%)
<b>Whittlesford</b>	SC 017 Duxford, The Abingtons, Whittlesford	45%	London SOA (6%)
<b>Sawston</b>	SC 015 Sawston	47%	Duxford SOA (19%)
<b>Comberton</b>	SC010 Caldecote, Comberton, Hardwick, Haslingfield and The Eversheds	54%	Milton SOA (6%)
<b>Cambourne</b>	SC 020 Bourn	45%	Milton SOA (6%)

*Table 7.2.4 – Work Destination from Hub Location*

*Source: 2011 Census Data (England & Wales)*

In all cases, Cambridge represented the most popular single destination from each of the hub locations. This shows that, as may be expected, a significant number of people living in the vicinity of the potential hub sites work in Cambridge, and as a result of this make journeys into Cambridge on a regular basis.

## 8.0 Services, Infrastructure & Facility Requirements

The services, infrastructure and facilities provided at each hub site will differ, with each hub being bespoke and individually designed and tailored to the community it serves and the available transport links. Below are some examples of the sort of facilities & amenities that could be offered.

### 8.1 Cycling

Cycling represents a transport mode which could be used both to and from a hub location. For example, users could travel to the hub on their cycles and then continue their onward journey by another transport mode, say, bus or rail – leaving their cycle at the hub. Alternatively, as in the case of a designated 'park & cycle' scheme, users may travel to the hub facility by car, bus etc. before continuing their onward travel by cycle.

#### 8.1.1 Cycle Storage Facilities

Where cycles are left or stored at hub sites, there is obviously the requirement for designated and secure storage facilities. Such facilities will act to encourage cyclists to use the hub and provide confidence that their cycles will be adequately protected from theft and/or vandalism.

#### 8.1.2 Secure Cycle Lockers

Cycle lockers provides a storage solution that offer enhanced security compared with traditional cycle storage facilities, such as cycle stands. Use of the fully enclosed and lockable unit is generally chargeable on a monthly basis for a small sum and offers robust protection for cycles. The units come in a variety of sizes to accommodate single or double occupancy. Where secure cycle lockers are provided, due consideration will need to be given to the costs associated with the administration, management and maintenance of the units. It is envisaged that these costs would be covered by the revenue generated from the secure cycle lockers.

#### 8.1.3 Covered Cycle Stands

Covered cycle stands provide protection for cycles against inclement weather. Some users may be reluctant to use their cycle if only uncovered storage provision is made.

### 8.2 Pedestrian/Cycle Links

Non-motorised user links between transport modes require consideration – i.e. how pedestrians and cyclists move between the hub and the desired transport mode. Footways/Cycleways should be provided which link to existing non-motorised user routes to provide continuous connectivity. Where hub sites are located close to the proposed Greenway routes there may be the opportunity for access improvements to be delivered as part of Greenways project.

Pedestrian routes to and from car parks with bays for disabled people should be free from steps, bollards and steep slopes which many disabled people find difficult to negotiate.

### 8.3 Car Parking

Car parking facilities are required for those users travelling to hub site by private vehicle. Facilities could also be incorporated to cater for users to be dropped off at the hub site.

#### 8.3.1 Size

The size of the car park will be determined by the level of envisaged use and will be established through community engagement. Whilst the number of spaces is not set, it is anticipated that these will be 'modest' in size and aimed predominantly for local use by those residents travelling from nearby parishes.

Due to the predicted population growth within South Cambridgeshire it may be appropriate to acquire additional land to facilitate future expansion of the hub. Hubs would only be extended where there is sufficient demand and following local consultation. Planning considerations would also need to be taken into account.

### 8.3.2 Access

Suitable vehicular access to the car park should be afforded from the existing highway. This could comprise an 'In/Out' arrangement or a more conventional junction. A number of considerations are required, including; visibility splay, designated lanes and swept-path analysis for larger vehicle movements. Access must also be provided for non-motorised users and pedestrian traffic in the form of footways to connect the car parks to the existing pedestrian routes and/or other facilities (bus stop / rail station). Some minor improvement works may be required to the existing highway to accommodate the accessibility arrangement.

### 8.3.3 Height Barriers

Access control measures can be achieved by the implementation of vehicle height barriers. Such barriers would permit car & motorcycle access only and prohibit access for larger/commercial vehicles.

### 8.3.4 Disabled Parking Provision

Suitable parking spaces for disabled users must be provided. In accordance with the *Department for Transport's Traffic Advisory Leaflet 5/95 – Parking for Disabled People (1995)* it is recommended that, for car parks with a capacity up to 200 bays, 3 bays or 6% of the total capacity (whichever is greater) should comprise of disabled bays. The location of the disabled bays needs to be considered. They should be ideally placed as close as possible to the main facility to be accessed (i.e. bus stop / rail station).

### 8.3.5 Signing

The parking facility should be suitably signed, although some parishes may prefer this to be understated in order not to attract large volumes of users from outside the immediate locality.

### 8.3.6 Drop-off/Pick-up Points

In addition to those leaving their private vehicles at the car park, provision should be allowed for a designated drop-off / set down area.

### 8.3.7 Landscaping

Due to the predominantly rural nature of the proposed hub locations it is important that aesthetics are considered at design stage. The car park should be visually attractive, not obtrusive and so a site-specific and sympathetic design approach is required. Natural screening from trees and shrubs could be incorporated to help the facility blend in to the surroundings. If so, it would be advisable that the species are native and correspond with the advice provided in South Cambridgeshire District Council's Landscape in New Developments SPD Adopted March 2010.

### 8.3.8 Charging

It is intended that car and cycle parking at the hub sites will be free of charge, although there will be a charge for cycle lockers.

### 8.3.9 Maintenance

It may be beneficial to provide litter bins at hub sites, however, this would likely incur cost and require a strategy for maintaining the collections. Therefore the requirement for litter bins needs to be discussed and agreed locally. Similarly the provision of grit bins could be considered and require similar consultation and agreement.

General maintenance responsibility for the hub site will need to be locally considered and agreed.

## 8.4 Public Transport

The hubs will be located close to existing public transport infrastructure or designated cycling routes. In some instances minor improvements may be required as detailed below.

# SKANSKA

---

## 8.4.1 Shelters

Shelters will be required with seated areas, allowing users to shelter from inclement weather and provide a degree of comfort.

## 8.4.2 Bus Stops

In some areas bus stops may require relocation, designated pull-in areas or even additional stops to be included within the given routes. As a result of any relocated/additional bus stops it may be necessary to revise bus timetable(s) to capture the new or relocated stop.

## 8.4.3 Real Time Information

Real time passenger information boards can be installed at bus stops to provide users with current information on service and assist with planning their journeys.

## 8.4.4 Ticketing

Automated ticket machines can be provided at hub facilities to enable users to purchase advanced tickets where the most probable mode of transport used would require one.

## 8.5 Lighting

New or additional road and footway lighting can have a major impact upon the character and appearance of an area. In rural locations high levels of night-time illumination are visually and environmentally undesirable, as is the impact of numerous lights and lighting columns. However, this has to be balanced against the advantages in terms of highway safety and personal security.

Low-level lighting may be preferable in car park areas to reduce the environmental impact. Part-night lighting and/or motion sensitive lighting could also be considered as a means of reducing the environmental impact.

Lighting schemes should be designed to limit obtrusive light using directional luminaires and light controlling attachments.

## 8.6 Technology (Smart Cambridge)

The Smart Cambridge initiative seeks to make travel easier, reduce congestion and explore intelligent mobility. The Rural Travel Hub facilities could assist with the promotion of this Smart Cambridge concept by providing better travel & transport information (e.g. real time displays) and making payment options easier for users (e.g. integrated ticketing machines).

## 8.7 Security

Security at the Hub locations is critical and the hub should be a safe and secure location for users and to park their cycles and cars. In addition to secure cycle lockers consideration should be given to closed-circuit television surveillance cameras to act as a deterrent. Furthermore, the location and layout of the Rural Travel Hubs needs to be considered to ensure it is not isolated or poorly overlooked preventing natural surveillance.

## 8.8 Materials

The rural nature of the hubs means it is important they are designed sympathetically, in keeping with their surroundings and using materials obtained from sustainable sources. Materials selection in terms of street furniture (e.g. shelters, litter bins, cycle stands, bollards etc.), paved surfaces and fencing, as well as landscaping, will be key in meeting this objective.

General considerations should include:

- Use of local materials wherever possible.
- Use of environmentally sustainable materials from a known source.
- Use of recycled materials from a known source.

- The weathering characteristics and life expectancy of the material.
- Ease of future maintenance and reinstatement.
- Availability of replacement materials.
- Keeping the number of signs to a minimum.

All materials, particularly with regard to paved surface specification, must provide a satisfactory level of safety, for example using textured paved surfaces to avoid slippery surfaces.

Sustainability issues must be properly addressed. This includes the whole life cost of the materials, the source, the distance they have to be transported and the method of delivery. Potential for re-use on site, recycling and methods of disposal have to be considered.

The flexibility around materials selection means that where a number of materials options are available, local consultation can be undertaken to aid selection of the most acceptable material.

## 9.0 Potential Hub Locations

Ten hub locations have been identified and reviewed as part of the feasibility study. The location map shown in Appendix H shows the location of all the potential hub sites.

### 9.1 Oakington Guided Busway Stop

The parish of Oakington is located to the north-west of Cambridge, approximately 5 miles from the city centre with a direct footpath .

#### 9.1.1 Location & Site Description

The proposed location of the Oakington Rural Travel Hub is adjacent to the Cambridgeshire guided busway route which runs generally north to south, bisecting the parishes of Oakington & Westwick (see Figure 9.1). A small parcel of agricultural land has been identified to the west of the guided busway, immediately south-west of the busways junction with Station Road. The site is accessible from Station Road which is a two-way single carriageway road, subject to a 30mph speed limit and is street-lit. A footway on the northern side of Station Road provides pedestrian access to the site from Oakington and Westwick. See Appendix A1 for existing site photographs.

Figure 9.1: Oakington Location Plan

(© Crown Copyright. All Rights Reserved. License Number 100023205.2017).

#### 9.1.2 Demographics

A Rural Travel Hub at Oakington would predominantly serve the parishes of Oakington & Westwick, Girton and Cottenham which had a combined population of 12,251 at the time of the 2011 Census.

#### 9.1.3 Travel Options to the City Centre

The sections below describe the travel options from the proposed location of the Oakington Rural Travel Hub to the city centre (for the purposes of this study defined as intersection of Sidney Street, Hobson Street and St. Andrews Street). By way of comparison the corresponding journey made by car would be approximately 8.4 miles and take approximately 25 minutes.

##### 9.1.3.1 Guided Busway

The Oakington Busway Stop is served by Routes A (St. Ives to Cambridge), B (Peterborough to Cambridge), C (St. Ives to Cambridge) & N (Longstanton to Cambridge) which afford access to Cambridge, with services departing every 12 minutes. Routes A, C & N are 5.8 miles via the guided route with a typical journey time of 22 minutes. Route B is marginally more direct at 5.6 miles but takes fractionally longer (25 minutes) due to the nature of route taken. The cost of a return ticket from Oakington Busway Stop to the city centre is £4.30. However, Busway services can be busy at peak times, with limited capacity.

### 9.1.3.2 Bus (Citi 6 Service)

Oakington village is also served by the Citi 6 service (Cambridge to Oakington) which affords access to the city centre with a typical journey time of 27 minutes following a route that is 6 miles long with services departing every 30 minutes. The cost of a return ticket from Oakington village to the city centre is also £4.30.

### 9.1.3.3 Cycle

A designated cycle facility runs adjacent to the guided busway, which will form the future St. Ives Greenway. The most direct cycle route to the city centre is via a combination of the cycle track and the use of local roads and represents a journey distance of 5.1 miles and is anticipated to take 28 minutes. Cycle improvements are being considered between Oakington Village and the busway as part of the proposed St. Ives Greenway Project.

## 9.1.4 Facilities

The existing and proposed facilities are presented below:

### 9.1.4.1 Existing

The existing facilities at the Oakington Busway Stop include:

- Bus shelters.
- Real Time Information.
- 15 no. covered cycle stands.
- CCTV.
- Emergency help points.
- Service information signs.
- Street lighting at Busway Stop and on Station Road.

### 9.1.4.2 Proposed

The facilities proposed for the Rural Travel Hub at Oakington comprise:

- A car park with 41 spaces including 3 designated disabled bays to ensure the facility is accessible for all users. This will be similar to the facility at Swavesey.
- Additional secure cycle parking including cycle lockers. These could be located on the guided busway, dependent on planning and space constraints.
- Drop-off/pick-up facility.
- Street lighting within the car park – requirements/specification to be agreed locally.
- Bus turn around/stop to allow the Citi 6 service to be extended up to the busway stop, including a shelter and raised ‘bus boarder’ kerbs. Local services including Demand Responsive Transport, Community Transport and future shuttle buses would also be able to utilise this facility.
- Widening of the existing footway between Oakington Village and the busway to improve pedestrian safety and accessibility.

## 9.1.5 Availability of Land & Planning Considerations

The small parcel of agricultural land that lines the western side of the Busway offers a potential location for the Rural Travel Hub car park. Initial Land Registry enquiries indicate the Title Absolute on the Proprietorship Register is listed as Cambridgeshire County Council.

### Potential Planning Constraints (Summary of comments from SCDC Planners)

- The site is within Flood Zone 3, meaning that there is a high probability of flooding. A flood risk assessment must be carried out prior to any development.

- The proposed site is outside of the village framework and therefore falls within the countryside.
  - The site located on land classified as **Green Belt**. Strong justification for this site will be required in order for this site to be considered. NPPF Paragraph 90 - Certain other forms of development are also not inappropriate in Green Belt provided they preserve the openness of the Green Belt and do not conflict with the purposes of including land in Green Belt. These include *local transport infrastructure which can demonstrate a requirement for a Green Belt location*
- *Sufficient information will need to identify why a Green Belt location has been chosen, and whether impact on openness and green belt purposes have been considered. Unless these tests are met, the development would be considered inappropriate development, and very special circumstances would need to be demonstrated.*
- A Conservation Area is located to the eastern edge of the guided busway, but the proposed site is not within it.
- *Westwick Hall is a grade II listed building in close proximity to the site, heritage impact upon the setting of the listed building will need to be considered and assessed. The SCDC Historic Buildings Officer recommends that careful consideration is given to the design of a Rural Travel Hub at this site to mitigate any significant harm to the Listed Building or Conservation Area.*
- The layout and access of the proposed rural hub would need to be developed further, due to the potential for conflict between buses turning & vehicles / NMUs accessing site and the lack of safe access for pedestrian and cyclists. The proximity of the proposed vehicular access to the Guided Busway was also raised as a concern. This is something that could be addressed through a pre-application and preliminary design stage.

### 9.1.6 Access & Conceptual Layout

Conceptual layouts for the proposed hub site can be found in Appendix B1. Two options have been developed. Option A includes a car park, bus turn around and cycle storage facility. A second option (Option B), excluding the bus turn around has also been developed which may be more economically viable and less visually intrusive, due to less extensive construction being required.

Vehicular access to the hub site would be constructed at the location of the existing maintenance hard standing on Station Road with a separate in/out arrangement. Minor vegetation clearance will be required to ensure adequate visibility splays are provided at the new access. It is encouraged that any new vegetation is replaced by native species.

It is advised that minimal tarmac be introduced to the front of the site, as identified on the conceptual drawing to mitigate any impact upon the rural character of the area.

The existing signal controlled pedestrian crossing on Station Road to the west of the busway facilitates pedestrian movements to the proposed hub site and the existing busway stops. However, the narrow footway (approximately 1m wide) linking Oakington village to the Busway requires widening to improve access to the site, particularly for wheel chair users and those pushing prams. Consideration will need to be given to a ditch that runs adjacent to the existing footway. Potential widening will require suitable piping or local diversion.

Cycle improvements are being considered between Oakington Village and the busway as part of the proposed St. Ives Greenway Project. This would improve cycle access to the busway cycle route and may encourage increased cycle usage.

Consideration will need to be given to the layout and location of various transport modes within the site. For example, cyclists should not have to ride across motorised access or through the site to access the cycle lockers. Nor should they have to ride across pedestrian access to the bus stops. This would ensure cyclists and pedestrian safety.

### 9.1.7 Oakington Site Summary

There is currently no parking facility at the Oakington guided busway stop. Providing a car park would follow the Swavesey model, allowing access to those in the locality who are unable to walk or cycle to the stop. The small size of the proposed car park means the impact on traffic levels locally would be minimal. The car park

# SKANSKA

---

may also result in a reduction in the number of motorists who currently park on-street in the village to access the busway as they will have a designated facility, improving the flow of traffic through the village.

The guided busway offers frequent services into Cambridge with bus journey times being comparable to journeys made by car. The reasonable cost of a return ticket (£4.30) is an advantage, particularly if users who would otherwise drive have to pay city centre parking charges. The busway services can be busy at peak times, with limited capacity. Oakington is one of the last stops before reaching Cambridge and users may be deterred if they cannot find a seat or even board the service. Additional services will need to be considered.

The close proximity of the site to Cambridge means, as found at Swavesey, the majority of users are likely to travel to and from Cambridge, with those living on the western side of the village most likely to use the proposed car park facility.

The provision of secure cycle lockers will encourage more people to cycle to or from the busway stop, who as at observed at Swavesey, may be currently deterred by cycle theft and vandalism.

The provision of a bus turn around would improve connectivity between the Citi 6 service and the guided busway services. This improved arrangement could be utilised for Demand Responsive Transport, Community Transport and facilitate the development of future shuttle buses between villages. However, the high cost associated with this improvement means further investigation and consultation is required to ascertain whether the potential benefits justifies the increased cost.

Widening the footway between Oakington Village and the busway stop would improve pedestrian safety and accessibility when walking to the site, particularly for wheelchair users and those pushing prams. Such improvements are also being considered within the scope of the proposed St. Ives Greenway project.

In regards to planning there are also numerous constraints adjacent to or on the site, such as the Green Belt, Listed Building and Conservation Area. As such, the Rural Travel Hub would need to give particular consideration to these matters.

Cambridgeshire County Council are the proprietor of the land identified for the hub site. This is likely to assist with land acquisition and aid delivery.

## 9.2 Linton

The parish of Linton is located to the south-east of Cambridge, approximately 10.5 miles from the city centre (direct path).

### 9.2.1 Location & Site Description

The proposed location of the Linton Rural Travel Hub is on Bartlow Road, to the east of Linton village centre, adjacent to the existing Bus Route No. 13 bus stops located close to The Ridgeway (see Figure 9.2). Bartlow Road is a single two-way carriageway, subject to a 30mph speed limit and is street-lit. A footway runs along the southern side of the road providing pedestrian access to the site from the village centre and the A1307. A small parcel of land has been identified to the west of Bartlow Roads junction with the A1307. See Appendix A2 for existing site photographs.

Figure 9.2: Linton Location Plan

© Crown Copyright. All Rights Reserved. License Number 100023205.2017)

## 9.2.2 Demographics

A Rural Travel Hub at Linton would predominantly serve the parishes of Linton, Hadstock, Bartlow & Horseheath and Balsham which have a combined population of 6,558 at the time of the 2011 Census.

## 9.2.3 Travel Options to the City Centre

The sections below describe the travel options from the proposed location of the Linton Rural Travel Hub to the city centre (for the purposes of this study defined as intersection of Sidney Street, Hobson Street and St. Andrews Street). By way of comparison the corresponding journey made by car would be approximately 11.7 miles and take roughly 33 minutes.

### 9.2.3.1 Bus

The Bartlow Road bus stops are served by Stagecoach Route 13, 13A & B (Cambridge to Haverhill) which afford access to Addenbrooke's Hospital and the city centre. These follow the A1307 along a route that is 11.4 miles long towards the city centre, with a journey typical time of 38-40 minutes. Services generally run every 30 minutes, with services increasing in frequency during morning peak times. The cost of a return Dayrider Plus ticket (purchased on-board) to the city centre is £6.70. Service improvements are likely to be delivered as part of the A1307 Three Campuses to Cambridge Project, speeding up journey times and making services more reliable.

### 9.2.3.2 Cycle

The most direct cycle route to the city centre is via the A1307, being approximately 11.2 miles in distance and is anticipated to take 58 minutes. There are no designated off-carriageway cycle facilities on the section of the A1307 between Linton and the Babraham Research Campus. Beyond the Babraham Research Campus a shared footway/cycleway follows the northern side of the A1307, affording cyclists access to Addenbrooke's Hospital and the city centre. It is likely that improved cycle infrastructure from Linton will be provided as part of the Greenways project and/or the A1307 Three Campuses to Cambridge Project.

## 9.2.4 Facilities

The existing and proposed facilities are presented below:

### 9.2.4.1 Existing

The only existing facilities close to the proposed hub site are the bus stops on Bartlow Road. These are marked with flag signs but no other facilities are provided for example hard standings, bus shelters or raised 'bus boarder' kerbs. Pedestrian access from the village and the A1307 to the bus stops is provided by a footway on the southern side of Bartlow Road.

### 9.2.4.2 Proposed

The facilities proposed for the Rural Travel Hub at Linton comprise:

- Car park with 41 spaces including 3 designated disabled bays.
- Drop-off/pick-up facility.
- Low level lighting within the car park – requirements/specification to be agreed locally.
- Bus stop improvements on Bartlow Road, including shelters, raised ‘bus boarder’ kerbs, hard-standings and Real Time Information signs.
- An uncontrolled pedestrian crossing on Bartlow Road to enable bus users to cross between the inbound and outbound bus stops.
- Secure cycle parking including cycle lockers.

### 9.2.5 Availability of Land & Planning Considerations

The small envelope of land identified appears to follow a previous alignment of Bartlow Road. Following initial Land Registry enquiries, no titles were found and further investigation is required. It may be that this area of land is considered to be Highway as located on an old alignment of Bartlow Road and appears to have been used previously as an area to store chippings for surface dressing operations.

#### **Potential Planning Constraints (Summary of comments from SCDC Planners)**

- The site is located within Flood Zone 1 classified area, meaning that there is a low probability of flooding. There is no requirement for a flood risk assessment for a development in flood zone 1 where it is smaller than one hectare; is not affected by sources of flooding other than rivers and the sea, for example surface water drains.
- The proposed site is outside of the village framework and therefore falls within the countryside.
- Due to its isolated location it may become an area for anti-social behaviour.
- The location of the proposed bus stops and pedestrian crossing on Bartlow Road may need to be revised/reviewed. This is something that could be addressed through a pre-application and at preliminary design stage.
- A key issue for this site is the relationship with developments recently permitted by the Council. North and South of Bartlow Road S/1963/15 was permitted in September 2017 for 55 dwellings. Developments were designed to include a landscape buffer between the sites and the A1307.

### 9.2.6 Access & Conceptual Layout

A conceptual layout showing the proposed hub car park, drop-off area and cycle storage facility is shown in Appendix B2.

Access to the proposed hub site will be directly off Bartlow Road. The access point would be constructed at the location of the existing field access/junction where the old alignment joins the new alignment of Bartlow Road. A separate in/out arrangement is proposed to allow an internal drop off area to be provided. Some vegetation clearance will be required to ensure visibility splays are adequate.

An uncontrolled pedestrian crossing will be required on Bartlow Road to enable bus users to cross between the inbound and outbound bus stops. The limits of the 30mph zones may need to be altered to accommodate the crossing and access at the proposed located.

### 9.2.7 Linton Site Summary

Providing a car park at the Linton Rural Travel Hub would allow access to Route 13 bus services for those in the locality who do not live directly on the bus route. The small size of the proposed car park (maximum 41 spaces) means the impact on traffic levels locally would be minimal. Many of the potential users are likely to travel from the parishes to the east of Linton, therefore the hub’s location to the east of the village means it is unlikely to generate a significant increase in traffic in the village.

Route 13 buses offer frequent services into Cambridge with bus journey times being approximately 5-8 minutes longer compared to journeys made by car. However, the relatively high cost of the return ticket (£8.00) may deter some potential users, unless ticketing costs can be reduced or subsidised in some way.

For keen cyclists parking and cycling to Cambridge may be attractive, with the provision of secure cycle lockers providing peace of mind if leaving their cycle on-site overnight. The high speed sections of the A1307 where no off-carriageway cycle currently exist may deter less confident cyclists. Cycle infrastructure improvements as part of the Greenways and/or A1307 projects are therefore important in the success of this site as a Park & Cycle facility.

Improvements to the existing bus stops on Bartlow Road will make them more accessible to users.

If it is confirmed that the land identified is considered Highway, this is likely to reduce costs associated with land acquisition.

A hub at this site could be delivered as part of the A1307 Three Campuses to Cambridge Project which aims to provide better bus, walking and cycling options for commuters along the A1307, linking communities and employment sites between Haverhill and Cambridge.

### 9.3 Shepreth Railway Station

The parish of Shepreth is located to the south-west of Cambridge, approximately 7.5 miles from the city centre (direct path).

#### 9.3.1 Location & Site Description

The proposed location of the Shepreth Rural Travel Hub is at Shepreth railway station, located to the north of the village centre (see Figure 9.3). An area of land has been identified approximately 150 metres to the north of the railway station and is accessible from Barrington Road. Barrington Road is a single two-way carriageway, subject to a 30mph speed limit and is street-lit. See Appendix A3 for existing site photographs.

Figure 9.3: Shepreth Location Plan

© Crown Copyright. All Rights Reserved. License Number 100023205.2017)

#### 9.3.2 Demographics

A Rural Travel Hub at Shepreth would predominantly serve the parishes of Shepreth, Barrington, Fowlmere and Orwell which have a combined population of 4,002 at the time of the 2011 Census.

### 9.3.3 Travel Options to the City Centre

The sections below describe the travel options from the proposed location of the Shepreth Rural Travel Hub to the city centre (for the purposes of this study defined as intersection of Sidney Street, Hobson Street and St. Andrews Street). By way of comparison the corresponding journey made by car would be approximately 9.2 miles and take roughly 30 minutes.

#### 9.3.3.1 Train

Shepreth railway station affords access to the city centre via the Great Northern Route (London Kings Cross to Kings Lynn), with a typical journey time of 33 minutes, including a 13 minute train ride to Cambridge Station and a 20 minute walk to the city centre. Rail services generally run hourly, although more frequent services are provided during the morning peak period. The cost of return travel is £5.00.

#### 9.3.3.2 Bus

The city centre can be accessed by bus via Route 26 and the Trumpington Park & Ride from the bus stops. However, there are no buses starting from the village centre, with users having to walk 0.7 miles to the A10 to reach the nearest bus stop. The bus journey time is typically 60 minutes with an hourly service provided. The cost of a return Dayrider Plus ticket (purchased on-board covering both services) to the city centre is £6.70.

#### 9.3.3.3 Cycle

The recently constructed off-carriageway cycle facilities alongside the A10 provide cycle access to the city centre. The A10 cycle route will form part of the Melbourn Greenway, therefore further improvements for cyclists are likely to follow. The route is approximately 8.8 miles in distance and is anticipated to take 42 minutes.

### 9.3.4 Facilities

The existing and proposed facilities are presented below:

#### 9.3.4.1 Existing

The existing facilities at Shepreth railway station include:

- A small car park with 12 spaces (including 1 disabled bay).
- 24 cycle stands (15 uncovered and 9 covered).
- Shelters on the platforms for train users.
- Real Time Information on the train platforms.
- Bus stops on Barrington Road, outside the railway station.

#### 9.3.4.2 Proposed

The facilities proposed for the Rural Travel Hub at Shepreth comprise:

- A car park with 51 spaces including 3 designated disabled bays.
- Drop-off/pick-up facility.
- Street lighting within the car park – requirements/specification to be agreed locally.
- Bus stops outside the main station building that could be used by Demand Responsive Travel, Community Transport and local shuttle buses.
- Secure cycle parking including additional covered cycle stands and cycle lockers at the main station building.
- Widening of the existing footway between the Railway Station and the proposed car park (a distance of approximately 150 metres) to ensure pedestrian safety and accessibility.

### 9.3.5 Availability of Land & Planning Considerations

The area of land identified to the north of the Railway Station is an industrial site (believed to be the site of the old Rhee Valley Cement Works) and now appears to be used as a hard-standing area for material storage. Initial Land Registry enquiries appear to show that this land is owned privately and that development may be subject to restrictive covenants. Further investigation is required.

#### Potential Planning Constraints (Summary of comments from SCDC Planners)

- The site is located within a Flood Zone 1, meaning that there is a low probability of flooding. There is no requirement for a flood risk assessment for a development in flood zone 1 where it is smaller than one hectare; is not affected by sources of flooding other than rivers and the sea, for example surface water drains.
- The proposed site is outside of the village framework, and therefore falls within the countryside
- The planning history for the site is detailed below, demonstrating its use for industrial purposes:
  - S/0070/91/F - Use as coach park with ancillary storage – Approved
  - S/2430/89/F – Use for Class B2 (General Industrial)– Approved
  - S/0775/83/F - Change of use to coal stacking ground and store - Approved
- The use of a brownfield site is likely to make a proposal at this site more favourable than other greenfield locations in the vicinity.
- Tree Preservation Orders - several Elms forming a shelter belt are located in the vicinity of the site.
- SSSI Impact Risk Zone Area radius of SSSI L Moor, Shepreth,

### 9.3.6 Access & Conceptual Layout

A conceptual layout showing the proposed hub car park and drop-off area facility is shown in Appendix B3.

Access to the proposed hub site will be directly off Barrington Road. A separate in/out arrangement is proposed to allow an internal drop off area to be provided. Some vegetation clearance will be required to ensure visibility splays are adequate.

The existing footway between the Railway Station and the proposed car park would need to be widened for a distance of approximately 150m to ensure pedestrian safety and accessibility.

### 9.3.7 Shepreth Site Summary

A Rural Travel Hub at Shepreth Railway Station would provide increased parking provision, allowing more residents of the village and neighbouring parish's access to rail services into Cambridge.

The small size of the proposed car park means the impact on traffic levels locally would be minimal. Many of the potential users are likely to travel from the parishes to the north of Shepreth (i.e. Barrington and Orwell), therefore the hubs location to the north of the village means it is unlikely to generate a significant increase in traffic in the village centre.

The railway offers frequent services into Cambridge with journey times being comparable to journeys made by car. The railway also offers reasonably priced travel which is likely to be attractive to users.

Improvements to the cycle parking, including secure cycle lockers at the main station building will encourage more people to cycle to the station.

Travelling to Cambridge from Shepreth via bus is not a viable option due to the lack of services to/from the village centre. However, the provision of bus stops outside the station would mean the site could be serviced more easily by future Demand Responsive Transport, Community Transport and local shuttle buses to improve connectivity with Shepreth and surrounding parishes.

It cannot be assumed that all hub users will be heading into Cambridge. It is likely that the hub site will also be used by commuters heading to other destinations by train, including London. This will inhibit the effectiveness of the site in terms of reducing the number of car journeys into Cambridge.

Further investigation of the land identified for the hub car park is required to determine if it is suitable for development.

## 9.4 Swavesey Guided Busway Stop

The parish of Swavesey is located to the north-west of Cambridge, approximately 9 miles from the city centre (direct path).

### 9.4.1 Location & Site Description

The proposed location of the Swavesey Rural Travel Hub is adjacent to the Cambridgeshire guided busway route which runs west to east, bisecting the parishes of Swavesey and Over (see Figure 9.4). A small parcel of agricultural land has been identified to the south of the guided busway. The site is accessible from Station Road which is a two-way single carriageway road, subject to a 30mph speed limit and is street-lit. A shared use footway/cycleway on the western side of Station Road provides pedestrian/cycle access to the site from Swavesey and Over. See Appendix A4 for existing site photographs.

Figure 9.4: Swavesey Location Plan  
(© Crown Copyright. All Rights Reserved. License Number 100023205.2017)

### 9.4.2 Demographics

A Rural Travel Hub at Swavesey would predominantly serve the parishes of Swavesey and Over which have a combined population of 5,325 at the time of the 2011 Census.

### 9.4.3 Travel Options to the City Centre

The sections below describe the travel options from the proposed location of the Swavesey Rural Travel Hub to the city centre (for the purposes of this study defined as intersection of Sidney Street, Hobson Street and St. Andrews Street). By way of comparison the corresponding journey made by car would be approximately 11.9 miles and take roughly 28 minutes.

#### 9.4.3.1 Guided Busway

The Swavesey Busway Stop is served by Routes A (St. Ives to Cambridge), B (Peterborough to Cambridge) and C (St. Ives to Cambridge) which afford access to the city centre, with services departing every 12 minutes. The journey time is typically 28 minutes. The cost of a return ticket from the Swavesey Busway Stop to the city centre is £6.70. However, busway services can be busy at peak times, with limited capacity.

#### 9.4.3.2 Bus (Citi 5)

Bus stops located on Station Road to the north of the Busway serve Citi 5 services (Cambridge to Fenstanton) which afford access to the city centre with a typical journey time of 60 minutes following a route that is

approximately 14 miles long with services departing every 2 hours. The cost of a return Dayrider Plus ticket (purchased on-board) to the city centre is £6.70.

### 9.4.3.3 Cycle

A designated cycle facility runs adjacent to the guided busway, which will form the future St. Ives Greenway. The most direct cycle route to the city centre is via a combination of the cycle track and the use of local roads and represents a journey distance of 9.8 miles and is anticipated to take 50 minutes. Cycle access to the site from Swavesey and Over may be improved as part of the St. Ives Greenway Project.

### 9.4.4 Facilities

The existing and proposed facilities are presented below:

#### 9.4.4.1 Existing

The existing facilities at the Swavesey Busway stop include:

- A car park with approximately 40 spaces (including 1 disabled bay).
- Drop-off/pick-up facility.
- 55 cycle stands (35 uncovered and 20 covered).
- Shelters at both inbound and outbound Busway stops.
- Real Time Information at both inbound and outbound Busway stops.
- Bus stops on Station Road, close to the existing Busway car park.
- CCTV at the Busway stops.
- Emergency Help points at the Busway stops.
- Busway ticketing machine.

#### 9.4.4.2 Proposed

The proposed improvements to the existing facilities at Swavesey comprise:

- An additional car park to the south of the busway, with 35 spaces including 3 designated disabled bays. As detailed in Section 5.0, the existing car park is at capacity, with bus users parking on-street in the village when the car park is full.
- Low level lighting within the car park – requirements/specification to be agreed locally.
- Additional secure cycle parking including cycle lockers. As detailed in Section 5.0, the fear of cycle theft and/or vandalism may deter some users from cycling to/from the site.
- Drainage improvements and lighting at the existing car park located to the north of the Busway.

### 9.4.5 Availability of Land & Planning Considerations

A parcel of agricultural land is located to the south of the Busway, bounding its southern perimeter. This site would provide direct access to the Busway for car park users, with vehicular access being provided off Station Road. Following initial Land Registry enquiries, no titles were found therefore further investigation is required.

#### Potential Planning Constraints (Summary of comments from SCDC Planners)

- The site is located within a Flood Zone 3, meaning that there is a high probability of flooding. A flood risk assessment must be carried out prior to any development.
- The proposed site is outside of the village framework, and therefore located in the countryside
- A Conservation Area is located immediately west of the proposed site (which lies east of Station Road), The proposed location would be in close proximity to Church and Manor House, both Grade 1 Listed Buildings, and also located adjacent to Priory Earthworks Scheduled Monument.

- The area proposed forms the entrance to the village, and these fields provide an open and rural setting. It is also located close to the grade 1 listed church and grade 1 manor house, with clear views between the church and this site, with potential for significant harm to the setting of heritage assets.

#### 9.4.6 Access & Conceptual Layout

A conceptual layout showing the proposed additional car park and cycle storage facility is shown in Appendix B4.

Vehicular access to the hub site would be provided directly off Station Road with a simple T-junction arrangement. Station Road is subject to a 30mph speed limit and is street-lit. Vegetation clearance will be required to ensure adequate visibility splays are provided at the new access.

The shared use footway/cycleway along the western side of Station Road/Over Road provides off-carriageway cycle access for those heading to the site from both Swavesey and Over. The signal controlled pedestrian crossings on Station Road facilitate pedestrian movements to the busway stops.

#### 9.4.7 Swavesey Site Summary

A scheme at Swavesey would look to improve and provide additional hub facilities (as detailed in Section 5.0), including increased car parking provision and improved/more secure cycle parking, allowing more residents of Swavesey and Over to access to the Guided Busway services into Cambridge.

Whilst the number of car park spaces at Swavesey would effectively double with the new car park, the local usage of the existing car park (as detailed in Section 5.0) means there is unlikely to be a significant increase in traffic within the locality, as these local users would otherwise be driving to alternative transport facilities (e.g. the Longstanton Park & Ride) or directly to their destination. The additional car park may also result in a reduction the number of motorists who currently park on-street in the village (when the car park is full) to access the busway as there will be more spaces available.

The guided busway offers frequent services into Cambridge with bus journey times being comparable to journeys made by car. However, the busway services can be busy at peak times, with limited capacity. Potential users may be deterred if they cannot find a seat or even board the service, therefore additional services will need to be considered.

The provision of secure cycle lockers will encourage more people to cycle to the busway stop, who as at observed at Swavesey, are currently deterred due to incidents of cycle theft and vandalism (as detailed in Section 5.0). The cycle lockers will also encourage people to park at the facility and cycle to Cambridge. Cycle access improvements from Swavesey and Over may also be delivered as part of the St. Ives Greenway Project.

The site is subject to a number of planning constraints which could make delivery of site in this location challenging in planning terms.

Following initial Land Registry enquiries, no titles were found therefore further investigation is required.

### 9.5 Foxton Railway Station

The parish of Foxton is located to the south-west of Cambridge, approximately 6.5 miles from the city centre (direct path).

#### 9.5.1 Location & Site Description

The proposed location of the Foxton Rural Travel Hub is at Foxton railway station, which is located to the northwest of the village centre (see Figure 9.5). An area of land has been identified approximately 50 metres to the north the railway station and is accessible from the A10 Cambridge Road. The A10 is a single two-way carriageway, subject to a 50mph speed limit and is street-lit. See Appendix A5 for existing site photographs.

Figure 9.5: Foxtton Location Plan

(© Crown Copyright. All Rights Reserved. License Number 100023205.2017)

## 9.5.2 Demographics

A Rural Travel Hub at Foxtton would predominantly serve the parishes of Foxtton, Barrington, Fowlmere and Thriplow, which have a combined population of 4,595 at the time of the 2011 Census.

## 9.5.3 Travel Options to the City Centre

The sections below describe the travel options from the proposed location of the Foxtton Rural Travel Hub to the city centre (for the purposes of this study defined as intersection of Sidney Street, Hobson Street and St. Andrews Street). By way of comparison the corresponding journey made by car would be approximately 7.6 miles and take approximately 22 minutes.

### 9.5.3.1 Train

Foxtton railway station affords access to the city centre via the Great Northern Route (London Kings Cross to Kings Lynn), with a typical journey time of 30 minutes, including a 10 minute train ride to Cambridge Station and a 20 minute walk to the city centre. Rail services generally run hourly, although more frequent services are provided during the morning peak period. The cost of return travel is £5.00.

### 9.5.3.2 Bus

The city centre can be accessed by bus via the hourly Stagecoach Route 26 service to the Trumpington Park & Ride site, with users having to change to access the city centre via the Park & Ride service. The total journey time is typically 43 minutes. The cost of a return Dayrider Plus ticket (purchased on-board covering both services) to the city centre is £6.70.

### 9.5.3.3 Cycle

A shared use off-road cycleway runs alongside the A10 providing a traffic free route towards the city centre, with the shortest cycle route to the city centre being 7.4 miles. It is anticipated that this journey would take approximately 36 minutes. The A10 will form part of the Melbourn Greenway, therefore further cycle improvements are likely in the future as part of the Greenways project.

## 9.5.4 Facilities

The existing and proposed facilities are presented below:

#### 9.5.4.1 Existing

The existing facilities at Foxton railway station include:

- 4 uncovered cycle stands, with pedestrian guard railings also being used for cycle storage due to a lack of capacity.
- Real Time Information at both inbound and outbound train platforms.
- Bus stop lay-bys for (Route 26 services) on either side of the A10, approximately 50 metres north of the railway station.

#### 9.5.4.2 Proposed

The proposed hub facilities at Foxton railway station comprise:

- A car park to the north of the railway station, with 35 spaces including 3 designated disabled bays.
- Street lighting within the car park – requirements/specification to be agreed locally.
- Bus stop improvements (including shelters, raised kerbs and Real Time Information) at the bus stops on the A10 to improve connectivity between the rail station and local services including the No. 26 service as well as Demand Responsive Transport and Community Transport services.
- Area for secure cycle parking. These would be located on the small triangle of land immediately north of the railway station.

#### 9.5.5 Availability of Land & Planning Considerations

A parcel of land is located to the north of the railway station and is currently owned privately, being used commercially as a hand car wash. The site has been particularly chosen because it is located on the eastern side of the A10 and would therefore not affect or be affected by any future schemes to remove the level crossing and replace with a bridge. Such a scheme would utilise the vacant land on the western side of the A10.

##### **Potential Planning Constraints (Summary of comments from SCDC Planners)**

- The site is located within a Flood Zone 1, meaning that there is a low probability of flooding. There is no requirement for a flood risk assessment for a development in flood zone 1 where it is smaller than one hectare; is not affected by sources of flooding other than rivers and the sea, for example surface water drains.

#### 9.5.6 Access & Conceptual Layout

A conceptual layout showing the proposed car park and cycle storage facility is shown in Appendix B5.

Vehicular access to the hub site would be provided directly off the A10 with a simple T-junction arrangement.

The shared use footway/cycleway along the eastern side of the A10 provides off-carriageway cycle access for pedestrians and cyclists heading to the site from both from the north and south.

The relatively small size of the car park means any increase in local traffic is likely to be negligible. The car park would allow a reduction the number of motorists who currently park on-street in the village on Station Road as there will be a designated car park available.

The conceptual layout identifies a cycle store which would appear quite open in the wider area. To ensure the development remains in keeping with the street scene, it is advised that landscaping should be implemented to the front of the cycle stores.

#### 9.5.7 Foxton Site Summary

A scheme at this location would improve and expand upon the current transport facilities at the railway station. The provision of a car park and improved/more secure cycle parking will allow more residents of the village and neighbouring parishes to access the rail services.

The small size of the proposed car park (maximum 35 spaces) means the impact on local traffic levels would be minimal, particularly as the hub is located on the A10 away from the village centre.

The railway offers frequent services into Cambridge with train journey times being comparable to journeys made by car. The reasonable cost of a return ticket (£5.00) is an advantage, particularly if users who would otherwise drive have to pay city centre parking charges.

It cannot be assumed that all hub users will be heading into Cambridge. It is likely that the hub site will also be used by commuters heading to other destinations by train, including London. This will inhibit the effectiveness of the sites in terms of reducing the number of car journeys into Cambridge.

Improvements to the cycle parking, including secure cycle lockers, will encourage more people to cycle to the station. The ongoing cycle improvements along the A10 together with planned improvements as part of the Melbourn Greenway Project will further encourage cycle usage.

Travelling to Cambridge from Foxton via bus is not a viable option due to the lack of direct services into Cambridge, longer journey times and higher travel costs. The provision of improved bus stops outside the station would mean the site can be serviced by future Demand Responsive Transport, Community Transport and local shuttle buses. This will improve connectivity with surrounding parishes.

## 9.6 Meldreth

The parish of Meldreth is located to the south-west of Cambridge, approximately 9 miles from the city centre (direct path).

### 9.6.1 Location & Site Description

Meldreth railway station is located at the southern end of the village and is accessible from the High Street (see Figure 9.6). An area of land has been identified adjacent to the existing station car park and is accessible from the existing car park access. See Appendix A6 for existing site photographs.

Figure 9.6: Meldreth Location Plan

© Crown Copyright. All Rights Reserved. License Number 100023205.2017)

### 9.6.2 Demographics

A Rural Travel Hub at Meldreth would predominantly serve the parishes of Meldreth, Melbourn, Fowlmere and Basingbourn, which have a combined population of 11,261 at the time of the 2011 Census.

### 9.6.3 Travel Options to the City Centre

The sections below describe the travel options from the proposed location of the Meldreth Rural Travel Hub to the city centre (for the purposes of this study defined as intersection of Sidney Street, Hobson Street and St. Andrews Street). By way of comparison the corresponding journey made by car would be approximately 10.7 miles and take approximately 28 minutes.

### 9.6.3.1 Train

Meldreth railway station affords access to the city centre via the Great Northern Route (London Kings Cross to Kings Lynn), with a typical journey time of 36 minutes (similar to the travel time by car), including a 16 minute train ride to Cambridge Station and a 20 minute walk to the city centre. Rail services are generally every 30 minutes. The cost of return train travel is £5.00, plus a £1.50 daily charge for car park users.

### 9.6.3.2 Bus

The bus stops on the High Street outside the station are only serviced by a local service (Route 128 Shepreth to Royston) which runs at infrequent intervals. The city centre can be accessed by bus via the Route 26 Melbourn to Trumpington Park & Ride service, with onward travel to city centre via the Park & Ride services. Bus users from Meldreth are required to walk 0.8 miles to Melbourn in order to access the Route 26 services. The total journey time is typically 1 hour 13 minutes. The cost of a return Dayrider Plus ticket (purchased on-board covering both services) to the city centre is £6.70.

### 9.6.3.3 Cycle

Cyclists from Meldreth are able to use shared use footway/cycleway that starts in Melbourn, running alongside Cambridge Road and then up the A10, providing a traffic free route towards the city centre. The shortest cycle route to the city centre is 10.6 miles and would take approximately 50 minutes. Future cycle improvements are likely as part of the Melbourn Greenways project.

## 9.6.4 Facilities

The existing and proposed facilities are presented below:

### 9.6.4.1 Existing

The existing transport facilities at the Meldreth station include:

- Car park for 46 vehicles (including 2 disabled bays), chargeable at a daily rate of £1.50.
- 6 uncovered cycle stands.
- Real Time Information at both inbound and outbound train platforms.
- Bus stops for Route 128 on the High Street near the access to the station car park.

### 9.6.4.2 Proposed

The proposed improvements to the existing transport facilities at Meldreth comprise:

- Additional car parking area next to the existing station car park, with 34 spaces including 3 designated disabled bays.
- Additional secure cycle parking including covered cycle stands and cycle lockers. These would be best located near to the station building within the footprint of the existing car park. Further investigation with the operators of the car park is required.
- Pedestrian route from the new area of parking and existing station car park.
- Street lighting within the car park – requirements/specification to be agreed locally.
- Investigate how to improve connectivity between the rail station and local bus services to improve accessibility to the station for those who do not drive. This could include Demand Responsive Transport, Community Transport and/or the provision of local shuttle bus services.

## 9.6.5 Availability of Land & Planning Considerations

A parcel of privately owned land is located to the south of the railway station and appears to have been previously used commercially, although the site is currently vacant. This site would be accessed off the existing station car park access.

### **Potential Planning Constraints (Summary of comments from SCDC Planners)**

- The site is located within a Flood Zone 1, meaning that there is a low probability of flooding. There is no requirement for a flood risk assessment for a development in flood zone 1 where it is smaller than one hectare; is not affected by sources of flooding other than rivers and the sea, for example surface water drains.
- Site lies within the development framework and is on a brownfield site.
- The planning application for the site (Former GoCold Building, Station Yard, High Street, MELDRETH, SG8 6JR). The status of this application is noted as “Out for Consultation”; details below:
  - S/1502/17/FL – Demolition of existing factory building and office, and construction of 27No. dwellings with associated landscaping.

### 9.6.6 Access & Conceptual Layout

A conceptual layout showing the proposed car park and cycle storage facility is shown in Appendix B6.

Direct access would be provided off the existing car park entrance, using the existing vehicular access off of the High Street. A simple T-junction is likely to be acceptable due to the low number of vehicles using the car park and low speeds. A designated pedestrian route would need to be provided for car park users to safely access the station.

The small scale of the proposed car park means the impact of additional traffic on the local network is likely to be minimal. The additional parking would allow a reduction in the number of motorists who park on-street in the village as there will be a designated car park available.

### 9.6.7 Meldreth Site Summary

A scheme at this location would look to improve and expand upon the current transport facilities at Meldreth Station, including additional car parking provision and improved/secure cycle parking, allowing more residents of the village and neighbouring parishes access to rail services.

The small size of the proposed additional car park means the impact on local traffic levels would be minimal.

The railway offers frequent services into Cambridge with train journey times being comparable to journeys made by car. The reasonable cost of a return ticket (£5.00) is also an advantage, particularly if users who would otherwise drive have to pay city centre parking charges.

The proposed hub car park is located close to existing chargeable parking facilities at Meldreth Railway Station. There is the potential for the proposed hub car park to quickly reach capacity, with car users electing to use the free facility.

It cannot be assumed that all hub users will be heading into Cambridge. It is likely that the hub site will also be used by commuters heading to other destinations by train, including London. This will inhibit the effectiveness of the sites in terms of reducing the number of car journeys into Cambridge.

Improvements to the cycle parking, including secure cycle lockers, will encourage more people to cycle to the station.

Travelling to Cambridge from Shepreth via bus is not a viable option due to the lack of direct services into Cambridge, longer journey times and higher travel costs. The provision of improved bus stops outside the station would mean the site can be serviced more easily by future Demand Responsive Transport, Community Transport and local shuttle buses, improving connectivity with surrounding parishes.

## 9.7 Whittlesford

The parish of Whittlesford is located to the south of Cambridge, approximately 7.5 miles from the city centre (direct path).

### 9.7.1 Location & Site Description

The proposed location of the Whittlesford Rural Travel Hub is near Whittlesford railway station (see Figure 9.7). An area of land has been identified on the southern side of Royston Road, approximately 650m west of the railway station.

There are currently proposals for transport improvements and additional parking on a large scale to be provided closer to the station. It is considered that a holistic approach needs to be taken. Consultation with all stakeholders is recommended to identify the additional parking requirements. Other transport improvements will need to be included in the consultation process such as bus turn around points to enable buses to serve the station directly.

The area of land identified to the west of the station could be used as a temporary parking area to provide an immediate increase in parking capacity whilst the longer term proposals are developed. The temporary car park would be located approximately 650m from the station. However, many station users currently park along Royston Road (for free) in the location of the proposed car temporary car park. See Appendix A7 for site photographs.

Figure 9.7: Whittlesford Location Plan

(© Crown Copyright. All Rights Reserved. License Number 100023205.2017)

## 9.7.2 Demographics

A Rural Travel Hub at Whittlesford would predominantly serve the parishes of Whittlesford, Duxford, Pampisford, Sawston and Thriplow which have a combined population of 12,588 at the time of the 2011 Census.

## 9.7.3 Travel Options to the City Centre

The sections below describe the travel options from the proposed location of the Whittlesford Rural Travel Hub to the city centre (for the purposes of this study defined as the intersection of Sidney Street, Hobson Street and St. Andrews Street). By way of comparison the corresponding journey made by car would be approximately 10 miles and take approximately 24 minutes.

### 9.7.3.1 Train

Whittlesford railway station affords access to the city centre via the West Anglia Main Line (London Liverpool Street to Cambridge), with a typical journey time of 27 minutes, including a 7 minute train ride to Cambridge Station and a 20 minute walk to the city centre. Rail services run every 15 minutes. The cost of return train travel is £6.00, plus a £7.60 daily charge for car park users.

### 9.7.3.2 Bus

The bus stops on Duxford Road (approximately 490m to the west of the railway station) provide an hourly service to the city centre via the Citi 7 service, with a journey typical time of 60 minutes. The cost of a return Dayrider Plus ticket (purchased on-board) to the city centre is £6.70.

The bus stop on Station Road East provides additional services towards the city centre via Route 7A at intervals between 1 hr 15 mins to 2 hours. It should be noted that bus users are required to change service at the Babraham Road Park & Ride Site for onward travel to the city centre.

### 9.7.3.3 Cycle

The most direct cycle route to the city centre is via a combination of local roads and the off carriageway section of NCN 11 from Great Shelford to Addenbrooke's. This represents a journey distance of 9.4 miles and is anticipated to take 50 minutes.

### 9.7.4 Facilities

The existing and proposed facilities are presented below:

#### 9.7.4.1 Existing

The existing facilities at Whittlesford Railway Station include:

- 377 parking spaces (split between two car parks either side of the station) with the peak daily parking charge of £7.60. The car park is street-lit.
- 10 no. covered and 15 no. uncovered cycle stands to the western side of the station. Cycle parking is judged to be at capacity, with bicycles being locked to railings to the eastern side of the station, where there are no stands.
- CCTV
- Onward travel information signs.
- Shelters/waiting rooms on the train platforms for passengers.
- Real Time Information on both inbound and outbound train platforms.

#### 9.7.4.2 Proposed

The facilities proposed for the Rural Travel Hub at Whittlesford comprise:

- New car park with 208 additional spaces including 12 designated disabled spaces.
- Street lighting within the car park – requirements/specification to be agreed locally.
- Additional secure cycle parking including covered cycle stands and cycle lockers. These would be best located near to the station building within the footprint of the existing car park. Further investigation with the operators of the car park is required.

### 9.7.5 Availability of Land & Planning Considerations

The parcel of land identified is currently used for agriculture. Initial Land Registry enquiries appear to show that this land is owned privately and that development may be subject to restrictive covenants. Further investigation is required.

#### Potential Planning Constraints (Summary of comments from SCDC Planners)

- The site is located within a Flood Zone 1, meaning that there is a low probability of flooding. There is no requirement for a flood risk assessment for a development in flood zone 1 where it is smaller than one hectare; is not affected by sources of flooding other than rivers and the sea, for example surface water drains.
- CCC & Highways England Depots may become vacant circa 2020, with the possibility of these sites being developed. Separately Abellio Greater Anglia **may** have submitted a pre-application for increasing the capacity of the existing chargeable parking facility at Whittlesford Rail Station. Additionally, there may be proposals for a transport hub facility as part of the AgriTech development, which also includes improvements to cycle facilities and a small bus interchange.
- The proposed location is located outside of the development framework and therefore falls within the countryside.
- The location is rural in character and therefore proposed lighting will need to ensure it does not cause adverse harm to biodiversity within the area, or neighbouring properties.
- Consideration will need to be given to the impact upon residential properties nearby.

### 9.7.6 Access & Conceptual Layout

A conceptual layout showing the proposed car park is shown in Appendix B7.

Access to the car park would be directly off Royston Road with a simple T-junction being proposed. Some vegetation clearance will be required to ensure visibility splays are adequate. Royston Road is a single two-way carriageway, subject to a 30 mph speed limit and is street-lit.

Pedestrian access to the station will be provided by the existing footway on Royston Road that leads to the station.

The conceptual layout identifies few cycle stores, however those currently available at the station are at capacity. As such, consideration should be given to increasing more cycle facilities on the Rural Travel Hub.

### 9.7.7 Whittlesford Site Summary

An additional temporary car park at Whittlesford would provide an immediate increase in parking capacity, allowing more residents of the village and neighbouring parishes access to rail services.

The impact on traffic levels locally would be minimal as the car park is located close to the A505, with only a local increase in traffic likely on Royston Road.

The railway offers frequent services into Cambridge with journey times being comparable to journeys made by car. The railway also offers reasonably priced travel (£6.00) which is likely to be attractive to users.

The proposed hub car park is located close to existing chargeable parking facilities at Whittlesford Railway Station. There is the potential for the proposed hub car park to quickly reach capacity, with car users electing to use the free facility.

It cannot be assumed that all hub users will be heading into Cambridge. It is likely that the hub site will also be used by commuters heading to other destinations by train, including London. This will inhibit the effectiveness of the sites in terms of reducing the number of car journeys into Cambridge.

Improvements to the cycle parking, including secure cycle lockers at the main station building, will encourage more people to cycle to the station. Liaison is required over the extent and positioning of the cycle parking.

There are a number current development proposals for this location, including extension of the existing car park, cycle improvements and a small transport hub facility. Whilst none have been formally approved, if progressed each of these could potentially have implications on the travel infrastructure in the vicinity of Whittlesford Station. Consequently, there needs to be a holistic approach looking at the wider context in order to ensure improved connectivity between rail and bus services.

There is 'Master Planning Exercise' which is a piece of work in its very early stages that is intended to look at Whittlesford as a whole with a strategic approach considering projects of GCP, County Council and private organisations.

## 9.8 Sawston

The parish of Sawston is located to the south-east of Cambridge, approximately 6 miles from the city centre (direct path).

### 9.8.1 Location & Site Description

The proposed location of the Sawston Rural Travel Hub is to the north of Sawston, close to the junction of the A1301 and Cambridge Road (see Figure 9.8), with the site being accessible from Cambridge Road. A small parcel of land has been identified on what is currently a large field used for agriculture. See Appendix A8 for existing site photographs.

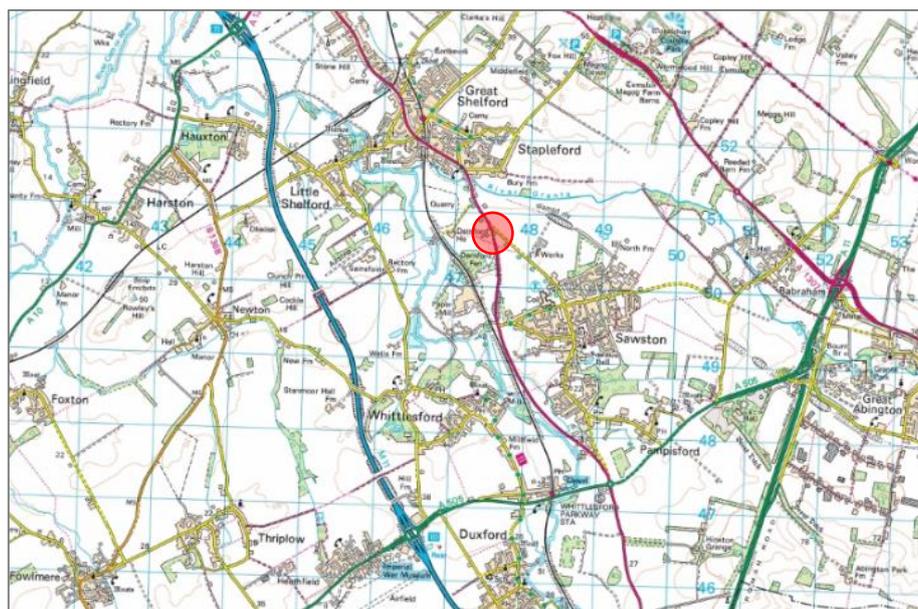

Figure 9.8: Sawston Location Plan

© Crown Copyright. All Rights Reserved. License Number 100023205.2017)

## 9.8.2 Demographics

A Rural Travel Hub at Sawston would predominantly serve the parishes of Sawston, Whittlesford, Pampisford, Duxford, Hinxton and Newton which have a combined population of 11,846 at the time of the 2011 Census.

## 9.8.3 Travel Options to the City Centre

The sections below describe the travel options from the proposed location of the Sawston Rural Travel Hub to the city centre (for the purposes of this study defined as intersection of Sidney Street, Hobson Street and St. Andrews Street). By way of comparison the corresponding journey made by car would be approximately 8.4 miles and take approximately 29 minutes.

### 9.8.3.1 Train

Hub users could park and cycle to Great Shelford railway station, with a 7 minute cycle ride to the station from the car park and then a 7 minute train ride into Cambridge. From Cambridge rail station it is then a 20 minute walk to the city centre. The total journey time is approximately 34 minutes. An hourly train service is provided to the city at a cost of £3.90 for return travel.

### 9.8.3.2 Bus

The Citi 7 bus passes by the proposed hub site on Cambridge Road. A service runs every 20 minutes, with a journey to the city centre taking 40 minutes. The cost of a return Dayrider Plus ticket (purchased on-board) to the city centre is £6.70. Additional bus stops would be required at the hub site as the nearest bus stops are in Sawston village adjacent to Spicers Sports Field. These serve Route 7A (Babraham Road Park & Ride – Whittlesford), 132 (Cambridge to Saffron Walden) and the Citi 7 (Cambridge to Saffron Walden).

### 9.8.3.3 Cycle

Hub users could park and cycle from the hub site into the city centre, following the route of NCN 11. The 8.1 mile long journey takes an estimated 41 minutes. A shared use footway/cycleway follows the A1301 from the proposed hub location toward Great Shelford, where cyclists then can continue along the route of NCN 11 towards Cambridge.

## 9.8.4 Facilities

The existing and proposed facilities are presented below:

## 9.8.4.1 Existing

There are currently no transport facilities at the hub site, but the site is on a section of NCN 11 which has good off-carriageway cycle facilities with Toucan crossings at the junction of the A1301 and Cambridge Road which assist cyclists in accessing the Cambridge bound cycleway.

Citi 7 bus services also pass the site. These provide a regular bus service into Cambridge at 20 minute intervals.

## 9.8.4.2 Proposed

The proposed hub facilities at Sawston comprise:

- Car park for 50 cars including 3 disabled bays. It is suggested that additional land is set aside for future expansion depending on the demand at the site.
- New bus stops with shelters, raised 'bus boarder' kerbs and Real Time Information so that the site can be serviced by the Citi 7 service, allowing users to park and ride into Cambridge.
- Secure cycle parking including cycle lockers to facilitate the site being used for parking and cycling.
- Low level lighting within the car park – requirements/specification to be agreed locally. The junction of the A1301/Cambridge Road is already lit therefore a power supply would be readily available.
- Drop-off/pick-up facility.

## 9.8.5 Availability of Land & Planning Considerations

The parcel of land identified is currently used for agriculture and owned by Cambridgeshire County Council, being designated as a 'Rural Asset'. As Cambridgeshire County Council are the proprietor of the land identified for the hub site this is likely to assist with land acquisition and aid delivery.

### Potential Planning Constraints (Summary of comments from SCDC Planners)

- The site is located within a Flood Zone 1, meaning that there is a low probability of flooding. There is no requirement for a flood risk assessment for a development in flood zone 1 where it is smaller than one hectare; is not affected by sources of flooding other than rivers and the sea, for example surface water drains.
- The site located on land classified as **Green Belt**. Strong justification for this site will be required in order for this site to be considered. NPPF Paragraph 90 - Certain other forms of development are also not inappropriate in Green Belt provided they preserve the openness of the Green Belt and do not conflict with the purposes of including land in Green Belt. These include *local transport infrastructure which can demonstrate a requirement for a Green Belt location*.
- *Sufficient information will need to identify why a Green Belt location has been chosen, and whether impact on openness and green belt purposes have been considered. Unless these tests are met, the development would be considered inappropriate development, and very special circumstances would need to be demonstrated.*
- The location of the Rural Hub would be hard to mitigate, as there are vast views across agricultural fields. It may mitigate adverse impacts if the site were designed to use the land adjoining the road junction, where there is more existing landscaping and existing lighting.
- Proximity to SSSI site at Dernford Fen, Sawston,

## 9.8.6 Access & Conceptual Layout

A conceptual layout showing the proposed car park is shown in Appendix B8.

The site would be accessed off the western side of Cambridge Road, with a new vehicular access being required into the site. Cambridge Road is a two-way single carriageway road and subject to the national speed limit (60 mph). It is lit at its junction with the A1301.

Pedestrian and cycle access would tie-in at the existing shared use cycleway that runs along the western side of Cambridge Road.

### 9.8.7 Sawston Site Summary

A Rural Travel Hub at Sawston would allow access to the Citi 7 bus services for those who do not live directly on the route.

The site could also be used as a 'Park & Cycle' facility, allowing users to take advantage of the facilities provided along National Cycle Network (NCN) Route 11 in order to access Cambridge directly or Great Shelford railway station for onward travel. Cycle parking, including secure cycle lockers, should be provided to encourage this.

The site has been positioned away from the village centre to reduce adverse impact of additional car journeys into the village. However, it could be moved closer to the village if there is a local desire.

Cambridgeshire County Council is the proprietor of the land identified. This is likely to reduce costs associated with land acquisition.

## 9.9 Comberton

The parish of Comberton is located west of Cambridge, approximately 4 miles from the city centre (direct path).

### 9.9.1 Location & Site Description

The proposed location of the Comberton Rural Travel Hub is at the eastern side of the village, on a parcel of land to the southeast of the B1046 Barton Road/Long Road mini roundabout (see Figure 9.9). The land is currently used for agriculture, with tall hedgerows bounding the northern and eastern perimeter of the site. See Appendix A9 for existing site photographs.

Figure 9.9: Comberton Location Plan

(© Crown Copyright. All Rights Reserved. License Number 100023205.2017)

### 9.9.2 Demographics

A Rural Travel Hub at Comberton would predominantly serve the parishes of Comberton, Little Eversden, Great Eversden and Bourn, which have a combined population of 4,202 at the time of the 2011 Census.

### 9.9.3 Travel Options to the City Centre

The sections below describe the travel options from the proposed location of the Comberton Rural Travel Hub to the city centre (for the purposes of this study defined as intersection of Sidney Street, Hobson Street and St. Andrews Street). By way of comparison the corresponding journey made by car would be approximately 6 miles and take approximately 20 minutes via the B1046 and A603.

# SKANSKA

## 9.9.3.1 Bus

Route 18 (Cambridge to Longstowe) follows the B1046 Barton Road past the proposed hub site. This provides an hourly service in the city centre, with the journey taking approximately 26 minutes. A return ticket costs £4.30.

## 9.9.3.2 Cycle

Cyclists could choose two routes to access the city centre by:

- (a) Following the B1046 and then the route of the future Barton Greenway alongside the A603 which equates to a distance of approximately 5.2 miles and would take approximately 25 minutes. There is an existing shared use footway/cycleway along most of this route.
- (b) Following the route of the future Comberton Greenway presents a slightly longer journey, a distance of approximately 5.7 miles with a journey time of approximately 28 minutes. The Comberton Greenway is not yet constructed and there are no cycle facilities on Long Road, heading north away from the village. This is a high speed (60mph) section of single carriageway which may deter less confident cyclists.

## 9.9.4 Facilities

The existing and proposed facilities are presented below:

### 9.9.4.1 Existing

There are currently no transport facilities at the location of the proposed hub site.

### 9.9.4.2 Proposed

The proposed improvements to the transport facilities at Comberton comprise:

- Car park for 50 cars with 3 designated disabled bays.
- Secure cycle parking including cycle lockers.
- New bus stops on the B1046 with raised 'bus boarder' kerbs, shelters and Real Time Information Signs so that the site can be directly serviced by the Route 18 bus.
- Low level lighting within the car park – requirements/specification to be agreed locally The B1046 is lit therefore a power supply would be readily available.
- Drop-off/pick-up facility.

## 9.9.5 Availability of Land & Planning Considerations

The land identified for the hub site is currently used for agriculture. Initial Land Registry enquiries appear to show that this land is owned privately and that development may be subject to restrictive covenants. Further investigation is required.

### Potential Planning Constraints (Summary of comments from SCDC Planners)

- The site is located within a Flood Zone 1, meaning that there is a low probability of flooding. There is no requirement for a flood risk assessment for a development in flood zone 1 where it is smaller than one hectare; is not affected by sources of flooding other than rivers and the sea, for example surface water drains. However, it is noted that Barton Road, within the confines of the carriageway is classified as Flood Zone 3. Land and property in flood zone 3 have a high probability of flooding. A flood risk assessment must be carried out.
- The site located on land classified as **Green Belt**. Strong justification for this site will be required in order for this site to be considered. NPPF Paragraph 90 - Certain other forms of development are also not inappropriate in Green Belt provided they preserve the openness of the Green Belt and do not conflict with the purposes of including land in Green Belt. These include: *local transport infrastructure which can demonstrate a requirement for a Green Belt location.*

- *Sufficient information will need to identify why a Green Belt location has been chosen, and whether impact on openness and green belt purposes have been considered. Unless these tests are met, the development would be considered inappropriate development, and very special circumstances would need to be demonstrated.*
- The Rural Travel Hub should be screened heavily with landscaping to mitigate the impact upon the character and appearance of the wider area.

### 9.9.6 Access & Conceptual Layout

A conceptual layout showing the proposed car park is shown in Appendix B9.

The vehicular access would be on the road that forms the southern arm of the B1046 Barton Road/Long Road mini roundabout, with a simple T-junction being proposed. A separate pedestrian access into the car park would be provided at the northwest corner of the field.

Pedestrian access will also be required on the northern side of the site to provide access to the new bus stops on Barton Road. An uncontrolled pedestrian refuge crossing on Barton Road is required to assist pedestrians crossing between the inbound and outbound bus stops. Barton Road at this location is a two-way single carriageway, street-lit and subject to a 30/40 mph speed limit.

### 9.9.7 Comberton Site Summary

The site would include the provision of a car park and secure cycle parking, allowing residents of neighbouring parishes where cycle access is currently poor to access the future Greenway routes in order to head into the city centre.

A Rural Travel Hub at this location could operate as a 'Park & Cycle' facility and would be ideally located at the start of the future Comberton Greenway. The existing shared use footway/cycleway along the B1046 provides cycle access towards the city centre via Barton. The only concern would be the distance to Cambridge may still deter cyclists to use this site, and it may benefit from being closer.

The site has been positioned away from the village centre to reduce adverse impact of additional car journeys into the village.

Bus and cycle journey times are comparable with car journey times. Bus fares are reasonably priced (£4.30). This is likely to attract usage of the site. However, bus services, which depart every 60 minutes, may not be frequent enough to attract local 'park and ride' usage. Additional bus services need to be considered at peak times.

The proposal would have to identify clearly why green belt land is required.

## 9.10 Cambourne

The parish of Cambourne is located to the west of Cambridge, approximately 8 miles from the city centre (direct path).

### 9.10.1 Location & Site Description

The proposed location of the Cambourne Rural Travel Hub is on the small parcel of land to the east of Broadway, situated between St. Neots Road and the A428 (see Figure 9.10). The land is currently used for agriculture, with tall hedgerows bounding the site perimeter. See Appendix A10 for existing site photographs.

Figure 9.10: Cambourne Location Plan

© Crown Copyright. All Rights Reserved. License Number 100023205.2017)

### 9.10.2 Demographics

A Rural Travel Hub at Cambourne would predominantly serve the parishes of Cambourne, Elsworth & Conington, Knapwell, Boxworth, Papworth Everard, Caxton and Bourn which have a combined population of 13,697 at the time of the 2011 Census.

### 9.10.3 Travel Options to the City Centre

The sections below describe the travel options from the proposed location of the Cambourne Rural Travel Hub to the city centre (for the purposes of this study defined as intersection of Sidney Street, Hobson Street and St. Andrews Street). By way of comparison the corresponding journey made by car would be approximately 9.3 miles and take approximately 30 minutes, via St. Neots Road and the A1303 Madingley Road.

#### 9.10.3.1 Bus

The Citi 4 service (Cambridge to Cambourne) follows St. Neots Road past the proposed hub site. This provides a service every 20 minutes into the city centre, with the journey along the 7.6 mile route taking approximately 26 minutes. The cost of a return Dayrider Plus ticket (purchased on-board covering both services) to the city centre is £6.70.

#### 9.10.3.2 Cycle

Following St. Neots Road and then Madingley Road presents a cycle route of approximately 7.5 miles in length, with a journey time of approximately 36 minutes. There are currently no off-carriageway cycle facilities along the high speed (60mph) single carriageway sections. This may deter less confident cyclists.

### 9.10.4 Facilities

The existing and proposed facilities are presented below:

#### 9.10.4.1 Existing

A pair of bus stops located on St. Neots Road to the west of the proposed hub site. These serve the Citi 4 service. The Cambridge bound stop has a bus shelter and bus layby, whereas the Cambourne bound bus stop is unmarked (i.e. no sign, shelter or layby).

A footway follows the southern side of St. Neots Road providing pedestrian access to/from the site.

#### 9.10.4.2 Proposed

The proposed transport facilities at Cambourne comprise:

- Car park for 41 cars including 3 disabled spaces (with additional land being set aside for future expansion depending on the demand at the site).
- Secure cycle parking including cycle lockers.
- Uncontrolled pedestrian refuge crossing on St. Neots Road to enable bus users to cross between the bus stops.
- Real Time Information at Cambridge bound bus stop lay-by.
- Low level lighting within the car park – requirements/specification to be agreed locally The B1046 is lit therefore a power supply would be readily available.
- Drop-off/pick-up facility.

#### 9.10.5 Availability of Land & Planning Considerations

The land identified as a potential hub site is currently used for agriculture and is under private ownership. The site has been selected because it is outside the proposed route of the Cambourne to Cambridge Busway and will therefore not be affected by this scheme in the future.

##### **Potential Planning Constraints (Summary of comments from SCDC Planners)**

The site is located within a Flood Zone 1, meaning that there is a low probability of flooding. There is no requirement for a flood risk assessment for a development in flood zone 1 where it is smaller than one hectare; is not affected by sources of flooding other than rivers and the sea, for example surface water drains.

The proposed site is outside of the village framework, and therefore located in the countryside

#### 9.10.6 Access & Conceptual Layout

A conceptual layout showing the proposed car park is shown in Appendix B10.

There are no private properties within the immediate vicinity of the site therefore the impact of additional traffic accessing the site will be minimal.

The existing access to the area of land identified will be used as the main vehicular access. A ghost island right turn lane is provided on St. Neots Road which assists vehicular movements into the site, which utilises a standard T-junction arrangement.

Pedestrian access to/from the site is via the existing footway on the southern side of St. Neots Road.

An uncontrolled pedestrian refuge crossing is required to assist pedestrians crossing between the inbound and outbound bus stops. St. Neots Road at this location is a two-way single carriageway, street-lit and subject to the national speed limit (60mph).

#### 9.10.7 Cambourne Site Summary

A Rural Travel Hub at this location would provide a park & cycle facility to the northeast of Cambourne on St. Neots Road.

Long distance cycle commuters regularly use St. Neots Road to head into Cambridge. The numbers of cyclists are likely to increase with the proposed cycle improvements on St. Neots Road being delivered as part of the Cambourne West development. Improvements will include a shared use footway/cycleway along St. Neots Road between Cambourne and the Madingley Mulch Roundabout, with cyclists then re-joining the carriageway and following the on-carriageway cycle lanes towards the city centre. Until these proposals are delivered, less confident cyclists may be deterred from using the facility.

There are no private properties within the immediate vicinity of the site therefore the impact of additional traffic accessing the site will be minimal.

---

Bus and cycle journey times are comparable with car journey times. Bus services are frequent. However, fares are relatively expensive (£6.70). This may deter those wishing to park & ride.

The proposed location may not be beneficial if/when the Cambourne to Cambridge Busway is implemented. Therefore the rural hub may only be a temporary solution.

The Parish Council are keen for a travel hub. They would like a hub to be in the vicinity of the High Street, given its location in the centre, near car parking and the routes of current buses. However, there are good cycle links into the centre of Cambourne and there are a number of bus routes passing through the village (including fast services for Cambridge). DRT (Demand Responsive Transport) schemes also operate into Morrison's car park. It is not felt that a hub in the centre of Cambourne would be a high priority given the nature of the existing facilities.

## 10.0 Preliminary Costings

Preliminary construction cost estimates have been produced for each of the 10 sites assessed (see Appendix G).

### 10.1 Summary of Costs

Typical construction costs have been used to calculate high level cost estimates for each site.

Due to uncertainty over how the land at each site would be acquired, costs associated with land acquisition have not been included.

Site	Cost Estimate (£)
Oakington - Option A (with bus turn around)	£368,107
Oakington - Option B (without bus turn around)	£217,664
Linton	£300,528
Shepreth	£226,590
Swavesey	£224,125
Foxton	£232,176
Meldreth	£144,933
Whittlesford	£599,933
Sawston	£377,253
Comberton	£355,875
Cambourne	£273,914

*Table 10.1 – High-level Cost Estimates*

## 11.0 Site Appraisal

In this section a strategy to produce an effective system for prioritising the proposed sites is presented. Key factors are identified which enables each site to be assigned a score resulting in an overall ranked order.

### 11.1 Site Prioritisation Methodology

A Site Appraisal Ranking (SAR) has been developed to facilitate the prioritisation of the proposed sites. The equation below has been used to calculate the individual site score and includes various factors for the different individual components considered. The coefficients and importance for each factor have been agreed following a review by the Project Team. The equation thus yields an overall weighted score for each site:

$$\text{Total Score} = 2R_{pop} + 3R_{br} + 3R_c + 3R_{cjs} + 3R_{cy} + 2R_{la} + 2R_{acc} + R_{pr} + R_{cps}$$

A matrix has been set-up using the 9 factors identified in the prioritisation criteria, namely;

- Population ( $R_{pop}$ ) – the total population of the surrounding parishes that the hub location is likely to serve. This indicates the approximate number of people who would feasibly benefit from the hub.
- Frequency of bus/rail ( $R_{br}$ ) – the frequency of public transport services (bus/rail) serving the hub location. The frequency of service is deemed a key factor in the attractiveness of a particular site.
- Cost of travel ( $R_c$ ) – the cost of return travel using public transport (bus/rail) from the hub location. Cost of travel is likely to have an impact on the amount of people using a hub at a given location.
- Car journey saving ( $R_{cjs}$ ) – measured as the number of car parking spaces provided at the hub. This is one of the key objectives of the Rural Travel Hub concept.
- Proximity to safe cycle route ( $R_{cy}$ ) – distance to the nearest off-carriageway cycle route that provides safe access to Cambridge.
- Land availability ( $R_{la}$ ) – considers high level planning issues such as proximity to Green Belts, Conservation Areas, flood risk etc. Land availability constraints may dictate the suitability of a site.
- Access ( $R_{acc}$ ) – considers the availability and suitability of highway access.
- Proximity to P&R ( $R_{pr}$ ) – distance to the nearest Cambridge Park & Ride facility. Close proximity to an existing major transport hub (such as a park & ride) may compromise the effectiveness of the Rural Travel Hub.
- Cost per space ( $R_{pr}$ ) – the cost per space is a measure of the minimum monetary cost per car journey saving. This is governed by the facilities provided and the potential number of people using the hub. This represents a basic 'cost-benefit' summary for the given site.

The above nine factors are considered on an individual basis for the 10 potential hub sites detailed in Section 9, before being combined for each site to yield an overall score. Prior to assigning scores, it is necessary to apply a weighting coefficient to each of these factors, as some are more influential than others in terms of determining the suitability of a given site. Consequently, the above list of principal factors is further split into three sub-categories, presented in order of importance. This represents a hierarchical categorisation which places a greater emphasis on certain factors relative to others. Details of this hierarchy are given below:

Sub-category 1 (Higher Priority):

- Car journey saving ( $R_{cjs}$ )
- Proximity to safe cycle route ( $R_{cy}$ )
- Frequency of bus/rail ( $R_{br}$ )
- Cost of travel ( $R_c$ )

Sub-category 2 (Medium Priority):

- Population ( $R_{pop}$ )
- Land availability ( $R_{la}$ )
- Access ( $R_{acc}$ )

Sub-category 3 (Lower Priority):

- Proximity to P&R ( $R_{pr}$ )
- Cost per space ( $R_{pr}$ )

Sub-category 1 comprises four of the nine principal factors which are considered to be highest priority. Among the primary drivers for the Rural Travel Hub concept is the reduction of car journeys into Cambridge and the promotion of more sustainable modes of transport (e.g. cycling). Therefore, it follows that car journey saving and proximity to a safe cycling route should feature within the highest priority factors. Additionally, the frequency of sustainable transport modes from that location and the associated cost are critical in assessing suitability of the hub location. The weighting coefficient associated with car journey saving, proximity to safe cycle route, frequency of bus/rail and cost of travel has been set to 3.

Sub-category 2 factors are those that are not the highest priority, but nonetheless are still considered sufficiently important to warrant an elevated weighting factor (i.e. medium priority). These include, population served, land availability and access. The population served is obviously key in terms of providing the maximum number of people to an accessible facility. Land availability and access are also deemed medium priority as there may be implications in terms of planning consent and existing infrastructure which may affect the feasibility of a given location. The weighting coefficient associated with population, land availability and access has been set to 2.

Sub-category 3 factors are those considered lower priority in terms of identifying suitable sites for the Rural Travel Hub facility, but still affect the prioritisation. These include proximity to existing Park & Ride sites and the cost of the facility on cost per space basis.

The above scoring framework has been developed by considering the primary factors that are deemed most important for identifying the most suitable locations for a Rural Travel Hub in the South Cambridgeshire District.

Based on the above methodology, the contribution for each element/factor to the overall SAR score is shown in Chart 11.1:

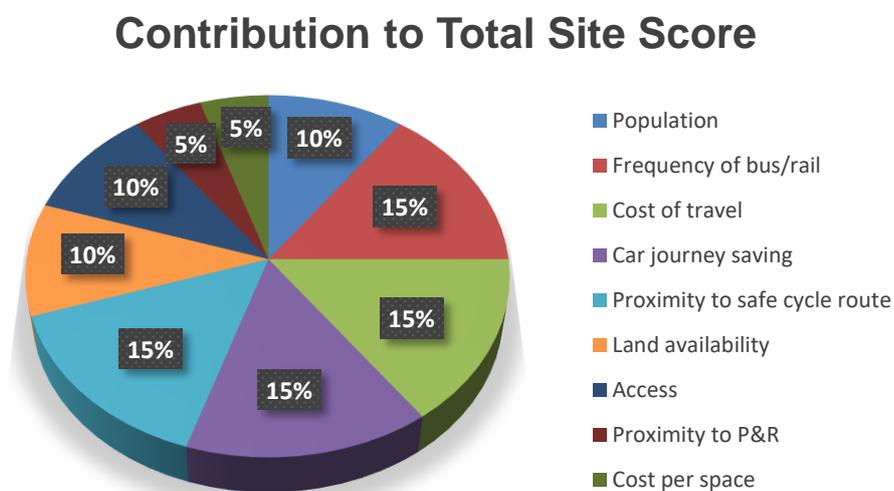

Chart 11.1 – Contribution of each element to total site score.

Having established this scoring mechanism, a matrix was set up enabling direct comparison between the 10 proposed sites from which an overall ranked order could be determined. The formula produces a score for each hub site between 20 (min) and 100 (max) – the results of which are shown below in Table 11.1. A full version of the prioritisation matrix, including individual site scores for each factor, is given in Appendix F1. Appendix F2 provides details of the scoring criteria, including the bandings for each factor. Appendix F3 comprises the site details that formed the basis of the score for each factor.

## 11.2 Site Prioritisation List

Individual scores for each site were determined and then the sites were ranked in order of descending score, the final order is shown in Table 11.1:

Parish	Location of RTH	Overall Score
Oakington B	Guided Busway Stop (without bus turn around)	80
Oakington A	Guided Busway Stop (with bus turn around)	76
Whittlesford	Whittlesford Railway Station	68
Sawston	A1307 j/w Cambridge Road	67
Swavesey	Guided Busway Stop	63
Meldreth	Meldreth Railway Station	62
Cambourne	St. Neots Road near its junction with Broadway	62
Comberton	B1046 Comberton Road	61
Shepreth	Shepreth Railway Station	60
Foxtton	Foxtton Railway Station	59
Linton	Bartlow Road	53

*Table 11.1 – Prioritised list of potential Rural Travel Hub sites.*

Table 11.1 indicates a ranked order of the potential hub sites based on the prioritisation criteria outlined in Section 11.1. Appendix F gives a breakdown of the site prioritisation matrix and gives a rationale of the overall scores for each of the 11 locations featured in table 11.1. Appendix F2 provides details of the scoring criteria, including the bandings for each factor. Appendix F3 comprises the site details that formed the basis of the score for each factor.

The scores indicate that the Oakington B (without the bus turn around) appears most suitable hub site overall. This is due to its close proximity to the guided busway, which offers frequent services at relatively low cost. The cycleway which runs adjacent the busway provides a safe and convenient cycle route into Cambridge, allowing users to park and cycle. The site is easily accessible from Oakington village. A hub facility here would broadly follow the Swavesey model which has proven to be successful.

Oakington Option A, including a bus turn around would offer additional connectivity compared to Option B, but the high cost associated with the construction of a bus turning circle means this option does not score as well as Option B.

The site at Whittlesford Railway Station would serve a large population in an area where there is high demand for interconnectivity between transport modes. The land availability and potential for access at this location mean that a substantially larger facility could be considered, potentially saving a significant number of car journeys.

It is recommended that Oakington Guided Busway Hub (Option B) and Whittlesford Railway Station hub warrant further evaluation as the two potential pilot sites. However, All ten sites considered have their merits and would be suitable for consideration should the Rural Travel Hub concept be expanded to include more locations.

## 12.0 Conclusion

Through the consultation and engagement process the following definition of a 'Rural Travel Hub' has been developed. The term 'Rural Travel Hub' is defined as:

***'a transport facility that serves as an interchange, close to existing transport corridors (that are served by a reliable and relatively frequent public transport service), where residents in rural areas can walk, cycle or drive to and continue their onward journey using a sustainable mode of travel'.***

Whilst the above definition outlines what the concept of a Rural Travel Hub is, the facilities provided at each site are likely to be different. Each hub site will be individually tailored to suit the community it serves, in terms of its location and the available transport links, with facilities being focussed on the predominant forms of transport to and from the site. It is not a case of 'one size fits all'.

The study included a detailed review of national, regional and local policy applicable to rural travel and the Rural Travel Hub concept. This has concluded that the concept and development of this type of infrastructure is supported at all levels.

Analysis of the Census data showed that car ownership and the number of residents travelling to work by car/van in South Cambridgeshire is higher than the Eastern region and significantly higher than that for England & Wales as a whole. Similarly, the number of people travelling to work by bicycle in South Cambridgeshire is significantly higher than the corresponding figure for both the East of England and England & Wales. It was also established that, as may be expected, a significant number of people living in the vicinity of the potential hub sites work in Cambridge, and as a result of this are making relatively short journeys into Cambridge on a regular basis. Improvements to public transport and greater provision for cyclists is likely to increase the potential for modal shift towards more sustainable forms of transport.

Whilst there are no existing designated Rural Travel Hubs in the South Cambridgeshire District, an existing transport facility at Swavesey has been reviewed as part of the Feasibility Study. The Swavesey Guided Busway Stop has evolved into something akin to a Rural Travel Hub, and perhaps best represents what a hub may look like. The usage survey at Swavesey was undertaken to understand how the hubs might work in practice. The findings have been used to inform the study and make suggestions of the type of services and infrastructure that could be included at hub sites.

As established in the Swavesey case study, it is envisaged that the proposed hub facilities will be mainly used by local residents, who would otherwise be travelling by private vehicle to their destination, such that any net gain in local traffic volumes is likely to be minimal.

A widespread consultation exercise across South Cambridgeshire has been conducted with potential stakeholders, community representatives and partners who will be involved in the development of the Rural Travel Hubs. This has been encouraging and revealed a high level of support for the concept of Rural Travel Hubs and their implementation. Consultees have actively engaged in the process and made useful and proactive suggestions for services and infrastructure. However, a number of general concerns were made by stakeholders during the engagement activities about the perceived frequency, capacity and connectivity of public transport in rural areas. Some of the issues may partly be addressed by the implementation of Rural Travel Hubs. Further detailed investigation and consideration is recommended particularly where there is strong local desire for better interconnectivity between outlying parishes, rather than improved links into Cambridge.

A district-wide review resulted in the identification of 10 sites that could be considered for a Rural Travel Hub in South Cambridgeshire. An appraisal process was then undertaken which reviewed each of the sites against the identified factors, considering the opportunities and constraints at each site. Adopting this approach a priority list was established to aid the identification of the two pilot sites.

The report has drawn on community views, a policy review and the review of the existing facilities at Swavesey to identify potential services, facilities and infrastructure that each hub site could contain. It has also identified the potential benefits and dis-benefits of Rural Travel Hubs.

---

High level cost estimates have been produced for the development Rural Travel Hub facilities at each site identified. These are designed to assist with the future allocation of budgets.

The feasibility study has found that the operation of Rural Travel Hubs in South Cambridgeshire is viable and that they are likely to be supported by the local community, serving to encourage more use of sustainable travel for journeys into Cambridge from outlying parishes.

## 13.0 Recommendations

Based on the site prioritisation process outlined in Section 11 it is recommended that the following sites are progressed as pilot sites:

- a) Oakington Guided Busway Stop
- b) Whittlesford Railway Station

The two proposed pilot sites, along with Swavesey, could then be monitored to establish usage patterns. The results of this monitoring process would then dictate whether further Rural Travel Hubs should be provided throughout South Cambridgeshire.

Subject to the approval of the Greater Cambridge Partnership's Assembly and Board the two identified pilot Rural Travel Hub sites should be taken forward to preliminary design, local consultation and planning permission/consent, and (subject to approval) construction.

Due to the relatively high costs it may be prudent for the construction at the pilot sites to initially be more temporary in nature. Following the monitoring period, if deemed successful, a permanent design solution could be developed

## **Whittlesford Parkway Station Masterplan Brief**

### **Introduction**

This brief sets out the Greater Cambridge Partnership's requirement for a high level strategic masterplan to be prepared for Whittlesford Parkway Station and its immediate surroundings. Several local transport issues have arisen within the vicinity of the station throughout recent years such as local congestion, bus turning issues at the station, and safety at the crossing towards Duxford on the A505 and thus cycle access. Together, with the increasing range of developments proposed for the area, increasing travel demands, and Whittlesford's recent allocation as a Greater Cambridge Partnership pilot Travel Hub, the station and surrounding area must be considered in fresh light in order to maximise its ability support such technological development whilst also safeguarding its rural character. The masterplan must be set in the context of Cambridgeshire's transport policies and strategy, and in the planning framework of South Cambridgeshire's Local Plan, and more locally, its fit within Whittlesford and neighbouring Parishes.

### **Purpose**

The masterplan should outline the long-term vision for the station and its surrounding area with the intention to deliver a new high quality multi-modal interchange station that meets SE Cambridgeshire's long-term rail needs. The station and surrounding area is an important gateway to nationally significant employment centres inclusive of the Wellcome Genome Campus/Sanger Institute, Babraham Research Campus, Granta Park, Cambridge Biomedical Campus (CBC), IWM Duxford and to Stansted Airport. The masterplan should therefore provide an initial concept and approach for improving the station gateway area.

### **Background**

As the masterplan will be Greater Cambridge Partnership (GCP) funded, it should set out the GCP vision and objectives. The background of the masterplan should identify the need for redevelopment and opening up of the station gateway as a crucial factor in the potential future growth of surrounding employment sites. Such growth at surrounding employment sites is inclusive of the Wellcome Genome Campus aspirations for 14,404sqm of additional GIA, growth at Granta Park for 55,300sqm of additional GIA, up to 10,000sqm of additional research and development floorspace at Babraham Research Campus, circa 300,000sqm of additional GIA and proposed 'Cambridge South' rail station at Cambridge Biomedical Campus, and an additional 11,397sqm of GIA at Sawston Trade Park. The masterplan should also highlight the railway station as a key asset, in addition to the existing conditions of its immediate surroundings.

There are a number of surrounding sites currently in commercial use which would also benefit from redevelopment at Whittlesford Parkway Station. The background should identify these employment hubs which take advantage of the proximity to both the rail station and road network. A series of proposals based on the differing development scenarios at Whittlesford Parkway Station which could come forward, in addition to the identification of the commercial viability of such scenarios should be developed and included within the masterplan.

**Requirements**

- The following core principles of the masterplan must fall in line with GCP objectives: improved sustainable connectivity (with onward travel from rail to bus, walking, cycling and the road network) and greater capacity for growth in rail-use.

The masterplan must cover the following:

- Existing travel patterns to and from Whittlesford Parkway Station in addition to the interaction with the local transport network must be set out. An understanding of the potential new station at Cambridge South (Cambridge Biomedical Campus) and its resultant transport implications should also be considered.
- Review of the existing passenger arrangements and facilities at Whittlesford Parkway in addition to the provision for a new multi-modal transport interchange inclusive of a new bus station, improved cycle access, increased long stay car parking, short-term parking, cycle parking, drop-off facility, taxi point and disabled parking. This should also include a design of the new layout for the interchange, station approaches and related land uses. The masterplan should also consider to what extent the above is viable and an appropriate option. It should take into account to what degree a full transport interchange can be developed at the station.

- A detailed assessment of the opportunity and need to construct a station building and an operational building at Whittlesford Parkway Station should be considered. The masterplanning work should however, exclude any work in relation to the operational working of the station, the track and operations themselves.
- A detailed review of the opportunities and constraints associated with the land surrounding the existing railway station. This should be inclusive of the existing surrounding road networks, and environmental considerations towards the development, for example habitat protected areas, flood risk areas, archaeological sites.
- A review of the current land ownerships within the study area should be provided and the masterplan should include an appraisal of the future development opportunities within the study area.
- Any proposals must complement each other and contribute to a station the vicinity needs now and in the future. It must show links to the existing wider transport and development plans for the area including:
  - Study work planned and funded by the Cambridgeshire and Peterborough Combined Authority to address capacity and congestion issues on the A505 between Royston and Granta Park/A11 (not yet started);
  - Cambridge South East Transport Study;
  - Cambridgeshire Rail Capacity Study;
  - Transport implications of a proposed AgriTech technology park at Hinxton, comprising up to 112,000sqm gross internal floor area and associated infrastructure inclusive of a bus/cycle interchange on land west of the A1301/north of A505, and highway improvements;
  - Transport implications of proposed redevelopment of the existing Cambridgeshire County Council and Highways England Maintenance Depots
  - Proposed North Uttlesford garden village to include 5,000 dwellings plus associated services and amenities on the land east of the A11 Hinxton;
  - Proposed expansion of Sawston Trade Park to increase the gross internal floor area on the park by 11,397sqm to 19,883sqm, and increase existing car parking capacity by 543 spaces to 670 in a multi storey car park;
  - Expansion of the Wellcome Genome Campus provided as Phases 2 and 3 to add 14,404sqm of GIA and associated infrastructure;
  - Expansion of the Cambridge Biomedical Campus. This comprises two phases; Phase 1 is underway and will add 220,005sqm of GIA to the site, whilst the current planning application for Phase 2 seeks to add up to 75,000sqm of additional GIA;
  - Proposed 'Cambridge South' rail station located near Addenbrooke's Hospital on the CBC.
- A comprehensive review of the existing public rights of way network surrounding Whittlesford Parkway Station. This should be inclusive of key footpaths and cycleways, the National Cycle Network Route 11, plus key sites including both employment hubs (campuses), and key leisure sites and settlements.

- Look to improve and develop cycle facilities and pedestrian access in the study area, linking the station to key sites such as employment and education sites and settlements. The masterplan should also seek to achieve an all-round improved public network connecting to Whittlesford village and the A505.
- Consider relevant national and local policies and documents. This should include reference to SCDC policies and such documents as the National Planning Policy Framework (NPPF), Cambridgeshire Local Transport Plan (2011-2031), Draft Whittlesford Neighbourhood Plan, Transport Strategy for Cambridge and South Cambridgeshire (TSCSC), and Cambridgeshire Long Term Transport Strategy (LTTS). The latter two strategies set out how the transport system should adapt to the growth in the area. They identify the need for a network of walking and cycling routes in and around the A1301 corridor, linking transport interchanges, employment centres, and the surrounding catchment area, focusing on:
  - Improving interchange facilities at Shelford, Whittlesford Parkway and Great Chesterford Stations;
  - Increasing frequency of services calling at Shelford and Whittlesford Parkway stations;
  - Creating a cycle network connecting employment sites at Babraham, Granta Park and Wellcome Genome Campus;
  - Creating a cycle network connecting to transport interchanges along corridors;
  - Continuing the cycle route from Shelford out towards Whittlesford Parkway Station;
  - Creating a cycle network focusing on the surrounding catchment area;
  - A comprehensive programme of small scale highway and safety improvements.
- Be mindful of the village setting.

### Deliverables

- Report - Chapters must include:
  - **Introduction** - This should provide a context to the proposed development;
  - **Framework principles** - This chapter should realise Whittlesford Parkway Station's strategic potential and the demand for better transport and movement. It should also specify the need for more facilities to support growth within the area inclusive of the demand to upgrade Whittlesford Parkway Station and utilise the village's gateways and corridors. This chapter should also detail the pressures for change;
  - **The Site** - This should review the existing road, rail and pedestrian network within and surrounding Whittlesford. A site assessment of Whittlesford Parkway Station should be incorporated and a review included detailing the existing transport systems readily available within the area. The land available for development must also be detailed. This chapter should also include a site appraisal to provide an assessment of the constraints and opportunities identified within the area. Such appraisal could be put in tabular form;
  - **Wider Development** - This should highlight the wider development plans for the area such as A505 improvements and the proposed North Uttlesford garden village. As increasing wider development in the area is expected to attract more employment and residential opportunities, this chapter should also outline the extent to which the local transport network can cope with such growth;

- **Proposed development** - This chapter should detail and assess the smaller proposals and associated infrastructure that make up the vision for a new multi-modal transport interchange at Whittlesford Parkway Station. It should also highlight the constraints of the proposals in addition to outlining the construction process, sustainability framework, and proposed transport connectivity;
  - **Development framework** - This should prioritise the development proposals and detail the phasing approach if appropriate, infrastructure delivery, funding sources, risks and management, and stewardship of the masterplan.
- Habitat Regulation Assessment (HRA) and Environmental Impact Assessment (EIA) - To consider the proposed development and what impacts are likely to arise.
  - Maps and Graphics - These should include:
    - A visual masterplan of the complete proposed development in addition to smaller and more-detailed visual plans for individual proposals;
    - Graphs to display data for existing and projected traffic growth and rail usage for each stage of development;
    - Junction capacity assessments.
  - The contractor should advise of any transport modelling they consider necessary to complete this commission.

### **Stakeholder engagement**

Stakeholders that should be engaged with as part of the development of the masterplan should be inclusive of Network Rail, Train Operating Companies, Parish Councils, neighbouring hotel, Highways England, Bus Operating Companies, and Cambridgeshire County Council Depot at Whittlesford. The Parish Councils to be engaged with should include Whittlesford, Duxford, Pampisford, Hinxtton, Sawston, Babraham, Great Abington and Little Abington. The masterplan document should be prepared with close input from South Cambridgeshire District Council and should outline the phasing of any works.

The contractor should advise of their stakeholder engagement plan in their submission, detailing the number and type of meetings.

### **Timescales**

This commission is for a strategic masterplan (Stage 1) and the requirements are as outlined above. It is likely that a detailed masterplanning stage (Stage 2) will follow.

Stage 1 commission should be completed within 3 months of appointment. Subject to consideration of the outcomes of Stage 1, Stage 2 will then be commissioned.

### **Costs**

Stage 1 works will be costed to the sum of £50,000. A pricing schedule is attached to the ITT for completion.
